**Disclaimer**

This Environmental Impact Assessment Report is being submitted in accordance with the terms and conditions of contract in respect of provision of consultancy services. It has been carried out in full observance of the EIA regulations and in compliance with the Environmental Management and Coordination Act, 1999 and subject to terms and conditions of the National Environment Management Authority (NEMA).
ACKNOWLEDGEMENT

The assessment team wishes to thank AWSB team who participated in conducting this EIA/RAP review by providing necessary assistance and relevant documentation.

We also wish to thank the Environment Officer for immense assistance and cooperation during our field visits and assistance in availing relevant information. Also, we thank the County, Sub-County and local administration, communities for their support, who graciously provided pertinent data and/or information, documents and actively participated and interacted with the EIA/RAP Consultancy Team.

EXECUTIVE SUMMARY

This document has been compiled and reviewed by the consultancy team on behalf of Athi Water Services Board. It identifies, describes, evaluates and develops means of mitigating potential negative environmental impacts of proposed drilling of a borehole within Ondiri area, Kiambu County.

The water supply in Ondiri area and its environs is inadequate and it is unlikely to satisfy the present population. The proponent proposes to drill borehole in order to improve water supply and availability to the residents. The main activities to be carried out include the actual drilling of borehole, casings and screens installation, borehole development, test pumping and submersible pump installation.

This has resulted in the proponent looking for the drilling of the borehole as the best alternative water supply mostly for domestic and institutional purposes. This Environmental Impact Assessment (EIA) study has been found necessary for this borehole drilling project in order to incorporate environmental issues during construction and operation. Environmental Impact Assessment for such projects is a requirement in Kenya under the Environmental Management and Co-ordination Act (EMCA) 1999 and World Bank Safeguard Policies.

This assessment was carried out by the consultancy team and examined the potential environmental impacts of the project on the immediate surroundings throughout the construction phase. It encompassed all aspects pertaining to the physical, ecological, socio-cultural, health and safety conditions at the site and its environs during drilling. The study was based on laid down scientific qualitative procedures with the most recent methodologies and analysis required in EIAs and, strictly adheres to the relevant legislative framework governing the groundwater abstraction industry.

Significant Environmental Impacts

Positive impacts: Increased access to water, creation of employment opportunities, improved health and sanitation of community members, reduced travel times to water points, increased participation of women in socio-economic development and improved household and community income generating activities.
**Negative Impacts:** Loss of vegetation, alteration or destruction of wildlife habitat, oil/grease spillage, noise pollution, air pollution, occupational health and safety hazards, soil erosion, financial burden to community members, water vectors and lowering of water table.

**Mitigation of Negative Impacts:** Chapter seven provides an elaborate matrix for the negative impact mitigation. Chapter eight presents a detailed Environmental and Social Management Plan with timelines and cost estimates where applicable for implementation by responsible parties or stakeholders.

**Issues raised during public consultations:** During public consultations, various aspects of the project were discussed. The issues raised by the community members touched on water scarcity, water conflicts and beneficiaries. Detailed account of the discussions is presented in chapter five.

**Recommendation:** It is recommended that the proponent, contractor and all the stakeholders mentioned in the ESMP implement the recommendations in the environmental and social management plan. During the operation and maintenance of the borehole, it is necessary that environmental regulations be strictly adhered to. The performance of the borehole should also be monitored against the recommended mitigation measures to ensure sustainability.

**Overall Public Opinion:** The construction of the proposed borehole at Ondiri, Kiambu County will have far reaching positive environmental impact on the community in terms of accessibility to quality water and reduction in waterborne diseases. The project area has water challenges which continue to stifle socio-economic development and threaten livelihoods. It is for this reason that the community members are very supportive of the project. It was also established that all the identified negative environmental impacts will be effectively mitigated through full implementation of the ESMP.

Chapter One

1. INTRODUCTION

1.1 Background
The Government of Kenya (GoK) has received credit from the World Bank through the International Development Association (IDA) towards the cost of Water and Sanitation Improvement Project Additional Financing (WaSSIP-AF). Part of this financing will be used to develop eight (8) boreholes within Athi Water Services Board (AWSB) area of operation. One of the boreholes will be developed in Ondiri Area of Kiambu County.

The area has experienced rapid and robust growth which has resulted to high pressure on the essential services including water for domestic use. The source of water currently in the area is from hand-dug wells which are becoming increasingly threatened by sanitation issues.

To accommodate the growing population water demand, the company has therefore proposed to drill a borehole to supplement the existing water source and to supply water to the up-coming dispensary, several institutions, shopping centres and the surrounding community.

This ESIA report therefore is for Ondiri borehole in Kiambu County.

1.2 The project
The scope of the proposed project will include the following:

i. Drilling of a borehole;
ii. Installation of an electric pump;
iii. Pipework;
iv. Elevated steel water tank; and
v. Construction of a pump house.
1.3 **Objectives of Environmental Impact Assessment (EIA)**

The overall objective of carrying out an Environmental Impact Assessment is to determine the likely impacts of a given project on the environment, propose possible mitigation measures and monitoring.

The Constitution of Kenya requires that environmental concerns are integrated in all economic development which calls for environmental integration in the project life cycle in order to:

(i) Protect and manage the environment for sustainable development  
(ii) Integration of environmental management and economic decisions at early planning stages  
(iii) Predict the consequences of a proposed project in terms of environmental, social, economic and cultural settings and propose mitigation measures  
(iv) Compare available alternatives for a particular project and determine the optimal mix of environmental and economic costs and benefits  
(v) Involve public, proponents, private and government agencies in assessment and review of a proposed project in an open, transparent and participatory approach.

1.4 **EIA Guiding Principles**

The guiding principles for Environmental Impact Assessment are:

(i) It requires that all environmental concerns must be accounted for in all development activities  
(ii) It also encourages public participation in all stages of proposed project development. It increases the ownership and sustainability  
(iii) It also recognizes the role of social and cultural principles traditionally used in the management of the environment and natural resources.  
(iv) International cooperation in the use and wise management of shared resources.  
(v) Intra-generation and inter-generation equality.  
(vi) Polluter-pays principle  
(vii) The precautionary principle
1.5 **Scope and Content of Project Assessment**

The project assessment investigates and analyzes the anticipated environmental impacts of the proposed drilling of the borehole in line with the Environmental Impact Assessment and Audit 2003 regulations. Consequently, the report provides the following:

- Nature of project.
- The location of the project including the physical area that may be affected by the project’s activities.
- The activities that shall be undertaken during the project installation, operation and decommissioning of the project.
- The materials to be used, products and by-product including waste to be generated by the project and the methods of disposal.
- The potential environmental impacts of the project and mitigation measures to be taken during and after the implementation of the project.
- An action plan for prevention and management of possible accidents during the project cycle
- A plan to ensure the health and safety of the workers and the neighboring communities
- The economic and social cultural impacts to local community and the nation in general

To achieve all this, a systematic approach was followed by the consultants who included the general steps outlined below:

- Environmental screening
- Environmental scoping which provided the key environmental issues
- Desktop studies
- Interviews with the Project Proponent
- Physical inspection of the site and surrounding areas
- EIA Public participation.
- Reporting including the preparation of an Environmental Management Plan.

All these aspects were considered accordingly. This report also seeks to ensure that all the potential environmental impacts are identified and that workable mitigation measures are
adopted. The report also seeks to ensure compliance with the provision of the EMCA 1999, and Environmental (Impact Assessment and Audit) Regulations 2003 as well World Bank safeguard policies.

The report emphasizes the duties of the proponent and contractor during the installation phase as well as the operation phase of this project.

1.6 Methodology
The assessment team used both primary and secondary data. Primary data was collected through consultation with the proponent, site visits and public consultations. While at the site, the consultant used key informant interviews, semi-structured interviews, observations and focus group discussions. Secondary data was obtained through literature review.

1.1.1 Literature Review
Information obtained through literature review enabled us to know:
- Amount of water required
- Water quality criteria to apply - potable, livestock etc.
- Hydrogeological information available
- Data gaps to be filled
- Social, environment, community and land ownership criteria likely to influence the sitting and operation of the project
- Relevant laws and regulations

1.1.2 Site Visits
We visited the project site in order to:
- Develop a better understanding of the project area
- Consult the local people about the proposed project and document their views
- Carry out hydrogeological surveys
- Assess project impacts
1.1.3  1.6.3  **Public Consultations**

Consultation was also undertaken as part of the EIA in order to obtain the views of members of the immediate community and interested and affected groups within the site’s immediate area of influence. The consultation was done with randomly selected people in the neighbourhood of the proposed site and involved use of a semi-structured interviews.

1.7  **Terms of Reference**

The environmental consultant as stipulated under the EMCA was commissioned by the proponent to undertake an Environmental Impact Assessment (EIA) study for the intended borehole drilling and to prepare a report for further examination by the National Environmental Management Authority (NEMA) and subsequent authorization to implement the proposed project.

1.8  **ESIA Team**

The Environmental Impact Assessment was undertaken by the following team of experts:

i.  Lead EIA Expert/Team Leader;

ii.  Environmentalist; and

iii.  Sociologist.
Chapter

Two

2. POLICY, LEGAL AND INSTITUTIONAL FRAMEWORK

2.1 Overview of the Policy Framework

1.1.4 2.1.1 National Water Policy

The National Policy of Water which was promulgated in April 1999 as Sessional Paper No. 1 of 1999 calls for decentralization of operational activities from the central government to other sectors, including local authorities, the private sector and increased involvement of communities in order to improve efficiency in service delivery. It also tackles issues pertaining to water supply and sanitation facilities development, institutional framework and financing of the sector. According to the policy, in order to enable sustainable water supply and sanitation services, there is need to apply alternative management options that are participatory through enhanced involvement of others in the provision of these services but particularly the private sector.

The overall objective of the National Water Policy is to lay the foundation for the rational and efficient framework for meeting the water needs for national economic development, poverty alleviation, environmental protection and social wellbeing of the people through sustainable water resource management.

1.1.5 2.1.2 Water Catchments Management Policies

The policy on water catchments management has been shaped over time by two Sessional Papers as listed below:

- Sessional paper No. 1 of 1968; and
- Kenya Forest Development Policy Sessional paper No. 9 of May 2005
Sessional Paper No. 9 encourages the involvement of the private sector, communities and other stakeholders’ participation in forest management in order to conserve water catchments areas and reduce poverty.

### 1.1.6 2.1.3 Policy on Environment and Development

This is presented as the Sessional paper No. 6 of 1999 on Environment and Development. The overall goal is to integrate environmental concerns into the national planning and management process and provide guidelines for environmentally sustainable development. Under section 4.3 of the document, Provision of potable water and water for sanitation is viewed as being central to satisfying basic human needs. It is indicated that the current water development programmes focus almost entirely on water delivery with little concern for demand management and conservation. Water resources have an extremely high value and effective mechanisms for managing and conserving water could result unto economic benefits as well as sustainable use of this vital resource.

Some of the key objectives of the policy are:

- To protect water catchments;
- To ensure all development policies, programmes and projects take environmental considerations into account, and
- To enhance, review regularly, harmonize, implement and enforce laws for the management, sustainable utilization and conservation of natural resources.

Under this policy, broad categories of development issues have been covered that require sustainable approach. The policy recommends the need for enhanced re-use/recycling of residues including water and wastewater as well as increased public awareness raising and appreciation of clean environment. It also enhances participation of stakeholders in the management of natural resources within their respective localities.

### 2.2 Overview of the Legislative Framework

#### 1.1.7 2.2.1 The Constitution of Kenya

The Constitution is the supreme law of the Republic and binds all persons and all State organs at all levels of government.
The Constitution of Kenya, 2010 provides the broad framework regulating all existence and development aspects of interest to the people of Kenya, and along which all national and sectoral legislative documents are drawn.

In relation to the environment, article 42 of chapter four, The Bill Of Rights, confers to every person the right to a clean and healthy environment, which includes the right to have the environment protected for the benefit of present and future generations through legislative measures, particularly those contemplated in Article 69, and to have obligations relating to the environment fulfilled under Article 70.

Chapter 5 of the document provides the main pillars on which the 77 environmental statutes are hinged.

Part 1 of the chapter dwells on land, outlining the principles informing land policy, land classification as well as land use and property.

The second part of this chapter directs focus on the environment and natural resources. It provides a clear outline of the state’s obligation with respect to the environment, thus;

“The state shall-

- Ensure sustainable exploitation, utilization, management and conservation of the environment and natural resources, and ensure the equitable sharing of the accruing benefits;
- Work to achieve and maintain a tree cover of at least ten per cent of the land area of Kenya;
- Protect and enhance intellectual property in, and indigenous knowledge of, biodiversity and the genetic resources of the communities;
- Encourage public participation in the management, protection and conservation of the environment;
- Protect genetic resources and biological diversity;
- Establish systems of environmental impact assessment, environmental audit and monitoring of the environment;
- Eliminate processes and activities that are likely to endanger the environment; and
Utilize the environment and natural resources for the benefit of the people of Kenya.” There are further provisions on enforcement of environmental rights as well as establishment of legislation relating to the environment in accordance to the guidelines provided in this chapter.

In conformity with the Constitution of Kenya, every activity or project undertaken within the republic must be in tandem with the state’s vision for the national environment as well as adherence to the right of every individual to a clean and healthy environment. The proposed project is a central development activity that utilizes sensitive components of the physical and natural environment hence need for a clearly spelt out environmental management plan to curb probable adverse effects to the environment.

1.1.8 2.2.2 The Environmental Management and Co-ordination Act (EMCA), 1999

This Act of Parliament, also known as EMCA, is the parent Act of Parliament that provides for the establishment of appropriate legal and institutional framework for the management of the environment and for matters connected therewith and incidental thereto.

EMCA, in its 13 interrelated parts, provides regulatory provisions for all levels of environmental conservation and management. The first four parts provide legislative guidelines on administrative and planning components of environmental management. They include;

(i) General Principles
(ii) Administration
(iii) Environmental planning
(iv) Protection and Conservation of the Environment. Parts five to seven focus on on-field management of the environment as an integral component of actual or proposed projects.
(v) Environmental impact assessments (EIA), audits and monitoring
(vi) Environmental audit and monitoring
(vii) Environmental quality standards.
The last five parts of the Act regulate on enforcement of provisions outlined in the Act and recognition of international agreements along which the EMCA has been established. They are; Environmental Restoration orders, Environmental Easements, Inspection, analysis and records, Inspection Analysis and Records, International Treaties, Conventions and Agreements, National Environment Tribunal, Environmental Offences.

All the chapters 1 to 13 apply to the proposed project at one stage or the other and therefore the project proponent is required to understand and conform with the Act accordingly. One such area is Environmental Impact Assessment. This is expressly stated in section 58(2) of the Act. “The proponent of a project shall undertake or cause to be undertaken at his own expense an Environmental Impact Assessment study and prepare a report thereof where the authority, being satisfied, after studying the project report under sub-section (1), that the intended project may or is likely to have or will have a significant impact on the environment, so directs.”

EMCA has set out several regulations for managing the environment which include the following:

**(a) The Environmental (Impact Assessment and Audit) Regulations, 2003**

This is a supplementary legislation to the EMCA. It gives additional “punch” by providing guidelines for conducting Environmental Impact Assessments and Audits. It offers guidance on the fundamental aspects on which emphasis must be laid during field study and outlines the nature and structure of Environmental Impact Assessments and Audit reports. The legislation further explains the legal consequences of partial or non-compliance to the provisions of the Act.

**Relevance**

The borehole construction as an activity is listed in the second schedule of EMCA as among projects that require an Environmental Impact Assessments before commencement. The project implementation cannot commence before the license is granted, upon conducting the EIA. For this reason, this report provides the legal requirements for the project approval.

Impacts of the borehole, involves major elements of the environment, including land, water and human health and safety. Therefore there is need to evaluate these impacts and
establish the most sustainable approach to benefit both the current and the future generations and mitigate projected negative impacts to people and the environment through conducting Environmental and Social Impact Assessment and subsequent audits.

(b) The Environmental Management and Coordination (Water Quality) Regulations, 2006

Described in Legal Notice No. 120 of the Kenya Gazette Supplement No. 68 of September 2006, these regulations apply to drinking water, water used for industrial purposes, agricultural purposes, recreational purposes fisheries and wildlife and any other purposes. It stipulates quality standards for sources and discharge of water to any environmental receptors within an activity area.

The Regulations outline various water quality standards in relation to use and discharge. Such aspects provided for are:

- Quality standards for sources of domestic water;
- Quality monitoring for sources of domestic water;
- Standards for effluent discharge into the environment;
- Monitoring guide for discharge into the environment;
- Standards for effluent discharge into public sewers;
- Monitoring for discharge of treated effluent into the environment.

Relevance

The proposed project will impound and abstract significant quantity of groundwater. It is thus fundamental to regularly analyze water quality and check for conformity to stipulated legal standards in this supplementary legislation.

Moreover, the quality of water discharges into any environmental receptor must be ascertained for safety and if not, treated.
(c) Environmental Management and Co-ordination (Waste Management) Regulations, 2006

Regulations guiding waste management are described in Legal Notice No. 121 of the Kenya Gazette Supplement No. 69 of September 2006. They offer legal provisions on handling of a variety of wastes emanating from various projects and activities. The waste categories covered by the regulations include:

- Industrial wastes;
- Hazardous and toxic wastes;
- Pesticides and toxic substances;
- Biomedical wastes;
- Radio-active substances

These Regulations outline requirements for handling, storing, transporting, and treatment / disposal of all waste categories as provided therein.

Relevance

The proposed project, during construction phase may involve the use of materials that release hazardous waste i.e. cement, oil spillage from vehicles, hence the need for all project actors to abide by these regulations in dealing with such wastes, especially the provisions of industrial, hazardous and toxic wastes which may be handled in the course of the project life.

(d) Environmental Management and Coordination (Fossil Fuel Emission Control) Regulations 2006

These regulations are described in Legal Notice No. 131 of the Kenya Gazette Supplement No. 74 of October 2006 and will apply to all internal combustion engine emission standards, emission inspections, the power of emission inspectors, fuel catalysts, licensing to treat fuel, cost of clearing pollution and partnerships to control fossil fuel emissions.

Relevance

The fossil fuels considered are petrol, engine oil and diesel. This will be applicable to equipment and machinery used in the project during construction phases of the project.
(e) Environmental Management and Coordination (Noise and Excessive Vibration Pollution) Control Regulations, 2009

These Regulations prohibit making or causing any loud, unreasonable, unnecessary or unusual noise which annoys, disturbs, injures or endangers the comfort, repose, health or safety of others and the environment.

Relevance

Under the regulation the Contractor is prohibited from producing excessive noise and vibrations which annoy, disturb, injure or endanger the comfort, repose, health or safety of others and the environment or excessive vibrations which exceed 0.5 centimeters per second beyond any source property boundary or 30 meters from any moving source. Under the regulation the Contractor will be required to undertake daily monitoring of the noise levels within the project area during construction period to maintain compliance.

1.1.9 2.2.3 Water Act, 2002

Water in Kenya is owned by the National Government, subject to any right of the user, legally acquired. However; this Act regulates conservation and management of all water resources within the republic, and related purposes.

In section 3 of part II, it states that every water resource is vested in the State, subject to any rights of user granted by or under this Act or any other written law. The Act also provides for establishment of a Water Resource Management Authority, whose aim is to manage and coordinate conservation and utilization of water resources at national scale.

As a subsidiary to the Act, a legislative supplement, The Water Resources Management Rules, 2007 was gazetted to guide all policies, plans, programmes and activities that are subject to the Water Act, 2002. The Water Resources Management Rules empower Water Resources Management Authority (WRMA) to impose management controls on land use falling under riparian land.
Relevance

Water demand is the sole driving factor in the drilling of the proposed borehole. In the proposed project, groundwater will be the main source of water whose abstraction must comply with the provisions and legal procedures in this Act. The Act will thus play a central role in guiding the exploitation of the ground water resource throughout the project life.

1.1.10 2.2.4 Occupational Health and Safety Act, 2007

The Act provides for the safety, health and welfare of workers and all persons lawfully present at workplace, as well as the establishment of the National Council for Occupational Safety and Health and for connected purposes.

Section 3(1) and (2) of the Act explains that it applies in all workplaces where any person is at work, either temporarily or permanently. It expounds on the purpose, which is to secure the safety, health and welfare of persons at work as well as protecting persons other than persons at work against risks resulting from, or connected to, activities at workplace. Further, sections 43 and 44 of part V give regulations on registration of work places.

Relevance

The project will require significant manpower during drilling and will thus result in employment of quite a number of people. Thus, compliance with the relevant provisions in this Act will be vital in ensuring that workers operate in safe healthy environment, and that their welfare shall be catered for. There will also be need for establishment of contractor's health and safety plan in line with this Act. There are a number of supplementary legislative rules to the OSHA. The most relevant are;

(a) The Factory and Other Places of Work (Medical Examination) Rules, 2005

This supplementary legislation covers workers who are exposed to specific occupational hazards for the purpose of preventing or controlling occurrence of occupational diseases.

In the first schedule of the legislation, works involving risks to healthcare are listed and recommended examinations and their respective intervals are indicated for adherence by employers or company directors. Sample requisite certifications are also provided for employers.
**Relevance**

All persons employed will be required to undergo pre-employment and periodic medical examinations to ascertain their fitness and also to maintain their health and safety at the workplace. Examinations certificates will be required on regular basis, hence the need for adherence.

Sections 1-4 of the legislation detail the permissible levels of noise in a workplace. Sections 5 and 6 elaborate on the recommended noise prevention programme as well as measurement and records to be undertaken by the contracted company during construction and even operational phases of the project.

**Relevance**

The construction phase of this project will involve use of heavy and noisy machines and equipment. This legislation will thus guide against health risks of excessive noise to workers at the work places, hence the relevance.

**1.1.11 2.2.5 The Public Health Act (Cap 242)**

This Act makes provision for securing and maintaining health. Part III and IV of the Act focuses on notification, prevention and suppression of infectious diseases, including inspection, disinfection and provision of medical aid to affected parties in case of outbreaks of infectious diseases. Part IX regulates on sanitation and housing, granting health authorities powers to prevent or remedy any dangers to health arising from poor handling of sanitation issues as well as improper housing and nuisances arising there from. Besides, regulations governing prevention and destruction of mosquitoes, encompassing due maintenance of yards, premises, wells, cesspits and identification and destruction of breeding places are entailed in part XII.

**Relevance**
Sanitation, housing, disease outbreaks and communal resource sharing are obvious issues in construction projects. The Public Health Act provides the necessary legal guidelines regulating measures aimed at effective control and management of the said issues.

1.1.12 2.2.6 **The Kenya Roads Board Act, 1999**

This is the one of the legal instrument that governs management of road network in the country.
Relevance

Of relevance with the proposed project is the need for consultative cooperation with the Roads authorities since the some pipeline routing will be laid within the road reserves.

1.1.13 2.2.7. Laws on Property and Land Rights in Kenya

The Constitution of Kenya (CoK), 2010 currently in force, replaced the 1969 constitution. It was approved by 67% of Kenyan voters and was promulgated on 27 August 2010.

The new Kenya Constitution has a comprehensive Bill of Rights in Chapter Four (4) and a well elaborated Chapter Five (5) on Land and Environment. These two chapters provide constitutional basis for land ownership, expropriation and protection of rights to land. Land in Kenya is classified as public, community or private. Prior to the new Constitution, there were over 70 pieces of legislations, Acts and subsidiary law governing land and land matters. Under the new Constitution they are being consolidated and rationalised to four pieces of legislation as follows:-

- National Land Act, 2012 – discusses Land issues in general and establishes mechanisms for Land acquisition;
- Land and Environmental Court – this establishes a court to deal with all disputes;
- Land Registration Act, 2012;
- The Community Land Act.

Article 60 (1) states that that “Land in Kenya shall be held, used and managed in a manner that is equitable, efficient, productive and sustainable, and in accordance to the following principles:

a) Equitable access to land;
b) Security of land rights
c) Sustainable and productive management of land resources;
d) Transparent and cost effective administration of land;
e) Sound conservation and protection of ecological sensitive areas;
f) Elimination of gender discrimination in law, customs and practices related to land and property in land; and
g) Encouragement of communities to settle land disputes through the recognized local community initiatives consistent with this Constitution.

The State is permitted to regulate the use of any land, or any interest in or right over any land in the interest of defence, public safety, public order, public morality, public health, or land use planning.

According to Article 61 (1), all land in Kenya belongs to the people of Kenya collectively as a nation, as communities and as individuals.

Land is classified as public land, community land or private land and each category is defined in the subsequent articles. Public land is defined to include all minerals and mineral oils; government forests, government game reserves, water catchment areas, national parks, government animal sanctuaries and specially protected areas, gazetted roads and thoroughfares, all rivers, lakes and other water bodies as defined by law; the territorial sea, continental shelf, exclusive economic zone and the sea bed, all land between the high and low water marks, any land not classified as community or private land under the Constitution—such public land shall vest and be held in trust by the national government in trust for the people of Kenya and shall be administered by the National Land Commission.

Community land includes land that is “lawfully held, managed or used by specific communities as community forest, grazing areas or shrines,” and “ancestral lands and lands traditionally occupied by hunter-gatherer communities.” Rights are also held through traditional African systems, and rights that derive from the English system introduced and maintained through laws enacted by colonial and then the national parliament. The former is loosely known as customary tenure bound through traditional rules (customary law). The latter body of law is referred to as statutory tenure, secured and expressed through national law, in various Act of parliament e.g. Land Act 2012, Land Registration Act, 2012, Trust Land Act (cap 288) of the Laws of Kenya.

The right to property is protected in Article 40 (1) Subject to Article 65; “every person has the right, either individually or in association with others, to acquire and own property of any description; and in any part of Kenya”.

The following land tenure systems exist in Kenya.

(i) Customary Land Tenure

This refers to unwritten land ownership practices by certain communities under customary law. Kenya being a diverse country in terms of its ethnic composition has multiple customary tenure systems, which vary mainly due to different agricultural practices, climatic conditions and cultural practices. However most customary tenure systems exhibit a number of similar characteristics as follows: First, individuals or groups by virtue of their membership in some social unit of production or political community have guaranteed rights of access to land and other natural resources. Individuals or families thus claim property rights by virtue of their affiliation to the group.

(ii) Freehold Tenure

This tenure confers the greatest interest in land called absolute right of ownership or possession of land for an indefinite period of time, or in perpetuity. Freehold land is governed by the **Land Registration Act, 2012**. The Act provides that the registration of a person as the proprietor of the land vests in that person the absolute ownership of that land together with all rights, privileges relating thereto. A freehold title generally has no restriction as to the use and occupation but in practice there are conditional freeholds, which restrict the use for say agricultural or ranching purposes only. Land individualization was demanded by the colonial settlers who required legal guarantee for the private ownership of land without which they were reluctant to invest.

(iii) Leasehold Tenure

Leasehold is an interest in land for a definite term of years and may be granted by a freeholder usually subject to the payment of a fee or rent and is subject also to certain conditions which must be observed e.g. relating to developments and usage. Leases are also granted by the government for government land, the local authorities for trust land and by individuals or organizations owning freehold land. The maximum term of government leases granted in Kenya is 99 years for agricultural land and urban plots. There are few cases of 33 years leases granted by government in respect of urban trust lands. The local authorities have granted leases for 50 and 30 years as appropriate.
(iv) Public Tenure

This is where land owned by the Government for its own purpose and which includes unutilized or un-alienated government land reserved for future use by the Government itself or may be available to the general public for various uses. The land is administered under the **Land Act 2012**. These lands were vested in the president and who has, normally exercised this power through the Commissioner of Lands, to allocate or make grants of any estates, interests or rights in or over un-alienated government land. However the new constitution grants those rights to the **National Land Commission (NLC)** which is governed by the National Land Commission Act, 2012 that specifies the role of NLC.

The **Land Act 2012**, Part III, Section 27 recognizes the capacity of a child as being capable of holding title to land. However this can only happen through a trustee and such a child shall be in the same position as an adult with regard to child’s liability and obligation to the land.

1.1.14 2.2.8 **Expropriation/Acquisition of Land and Compensation of Land and other Assets**

2.2.8.1 **The Constitution of Kenya, 2010**

CoK protects the sanctity of private property rights and states that no property can be compulsorily acquired by the Government except in accordance with law. Article 40(3) states:

“The State shall not deprive a person of property of any description, or of any interest in, or right over, property of any description, unless the deprivation results from an acquisition of land or an interest in land or a conversion of an interest in land, or title to land, in accordance with Chapter Five; or is for a public purpose or in the public interest and is carried out in accordance with this Constitution and any Act of Parliament that –

(i) Requires prompt payment in full, of just compensation to the person; and

(ii) Allows any person who has an interest in or right over, that property a right of access to a court of law
The Constitution empowers the state to exercise the authority of compulsory acquisition. **Land Act 2012 (LA)** designates the **National Land Commission (NLC)** as the agency empowered to compulsorily acquire land. Article 40 of the Constitution provides that the state may deprive owners of property only if the deprivation is "*for a public purpose or in the public interest,*" which includes public buildings, roads, wayleaves, drainage, irrigation canals among others. The state's exercise of this power is left at the discretion of National Land Commission, and requires the state to make full and prompt payment of "*just compensation*" and an opportunity for appeal to court.

**Article 40 (3) (a)** refers to acquisition and conversion of all kinds of land in Kenya (private, public, community land and foreign interests in land). The Constitution further provides that payment of compensation shall be made to "*occupants in good faith*" of land acquired by the state who do not hold title for such land [Article 40 (4)]. An occupant in good faith is a "*bona fide*" occupant. On the other hand, under the Constitution, those who have acquired land illegally are not regarded as deserving any compensation [Article 40 (6)].

**2.2.8.2 The Land Act, 2012**

The Land Act is the Kenya’s framework legislation regulating compulsory acquisition of land (i.e. land, houses, easements etc.). The Land Act was adopted on 2nd May 2012 and provides for sustainable administration and management of land and land based resources including compulsory acquisition.

**Section 107 (1)** provides for the power of entry to inspect land. **Sub-section (1)** states that whenever the national or county government is satisfied that it may be necessary to acquire some particular land under section 110, the respective Cabinet Secretary or the County Executive Committee Member shall submit a request for acquisition of public land to the Commission to acquire the land on its behalf. **Sub-section (2) requires** that the Commission prescribe a criteria and guidelines to be adhered to by the acquiring authorities in the acquisition of land.

**Sub-section(5)** stipulates that upon approval of a request under sub-section (1), the Commission shall publish a notice to that effect in the Gazette and the county Gazette, and shall deliver a copy of the notice to the Registrar and every person who appears to the Commission to be interested in the land.
Sub-section (8) states that all land to be compulsorily acquired shall be geo-referenced and authenticated by the office or authority responsible for survey at both the national and county government.

Under Section 108 (1) The Commission may authorize, in writing, any person, to enter upon any land specified in a notice published under section 107 and inspect the land and to do all things that may be reasonably necessary to ascertain whether the land is suitable for the intended purpose.

Section 109 provides payment for damage for inspection. As soon as practicable after entry has been made under section 108, the Commission shall promptly pay in full, just compensation for any damage resulting from the entry.

Section 110 (1) stipulates that land may be acquired compulsorily under this Part if the Commission certifies, in writing, that the land is required for public purposes or in the public interest as related to and necessary for fulfillment of the stated public purpose.

Section 111 (1) states that if land is acquired compulsorily under this Act, just compensation shall be paid promptly in full to all persons whose interests in the land have been determined. Under Subsection (2), The Commission shall make rules to regulate the assessment of just compensation.

Section 112 (1) requires that at least thirty days after publishing the notice of intention to acquire land, the Commission shall appoint a date for an inquiry to hear issues of propriety and claims for compensation by persons interested in the land, and shall

(a) cause notice of the inquiry to be published in the Gazette or county Gazette at least fifteen days before the inquiry; and

(b) serve a copy of the notice on every person who appears to the Commission to be interested or who claims to be interested in the land.

Section 113 (1) requires that upon the conclusion of the inquiry, the Commission shall prepare a written award, in which the Commission shall make a separate award of compensation for every person whom the Commission has determined to have an interest in the land. Every award shall be filed in the office of the Commission (Subsection 4).
Part III of the Land Act 2012, section 113 (2a) states that “the Commission shall determine the value of land with conclusive evidence of (i) the size of land to be acquired; (ii) the value, in the opinion of the Commission, of the land; (iii) the amount of compensation payable, whether the owners of land have or have not appeared at the inquiry.”

Market value of the property, which is determined at the date of the publication of the acquisition notice, must be taken into account when determining compensation. Determination of the value has to take into consideration the conditions of the title and the regulations that classify the land use e.g. agricultural, residential, commercial or industrial. Increased market value is disregarded when:

- It is accrued by improvements made within two years before the date of the publication of the acquisition notice, unless it is proved that such improvement was made in good faith and not in contemplation of the proceedings for compulsory acquisition. It is accrued by land use contrary to the law or detrimental to the health of the occupiers of the premises or public health.

- Any damages sustained or likely to be sustained by reason of severing such land from other land owned by the claimant.

- Any damage sustained or likely to be sustained if the acquisition of the land had negative effects on other property owned by the claimant.

- Reasonable expenses, if as a consequence of the acquisition, the claimant was compelled to change his residence or place of business (i.e., compensation for disruption to the claimant’s life).

- Any damage from loss of profits over the land occurring between the date of the publication of the acquisition notice and the date the NLC takes possession of the land.

Section 114 (2) stipulates that upon acquisition of land, and prior to taking possession of the land, the Commission may agree with the person who owned that land that instead of receiving an award, the person shall receive a grant of land, not exceeding in value the amount of compensation which the Commission considers would have been awarded, and upon the conclusion of the agreement that person shall be deemed to have conclusively
been awarded and to have received all the compensation to which that person is entitled in respect of the interest in that land.

Section 115 stipulates that upon the conclusion of the inquiry, and once the NLC has determined the amount of compensation, NLC will prepare and serve a written award of compensation to each legitimate claimant. NLC will publish these awards which will be considered “final and conclusive evidence” of the area of the land to be acquired, the value of the land and the amount payable as compensation. Land Act, Section 115 further stipulates that an award shall not be invalidated by reason only of a discrepancy between the area specified in the award and the actual area of the land. Compensation cannot include attorney’s fees, costs of obtaining advice, and costs incurred in preparing and submitting written claims.

A notice of award and offer of compensation shall be served to each person by the Commission. Section 120 provides that “first offer compensation shall be paid promptly” to all persons interested in land. Section 119 provides a different condition and states that the NLC “as soon as practicable” will pay such compensation. Where such amount is not paid on or before the taking of the land, the NLC must pay interest on the awarded amount at the market rate yearly, calculated from the date the State takes possession until the date of the payment.

In cases of dispute, the Commission may at any time pay the amount of the compensation into a special compensation account held by the Commission, notifying the owner of the land accordingly. If the amount of any compensation awarded is not paid, the Commission shall on or before the taking of possession of the land, open a special account into which the Commission shall pay interest on the amount awarded at the rate prevailing bank rates from the time of taking possession until the time of payment.

Once the first offer payment has been awarded, the NLC will serve notice to landowners on the property indicating the date the Government will take possession. Upon taking possession of land, the commission shall ensure payment of just compensation in full. When this has been done, NLC removes the ownership of private land from the register of private ownership and the land is vested in the national or county Government as public land free from any encumbrances (Section 115 & 116).
On the other side, the Commission also has the power to obtain temporary occupation of land. However, the commission shall as soon as is practicable, before taking possession, pay full and just compensation to all persons interested in the land.

In cases of where there is an urgent necessity for the acquisition of land, and it would be contrary to the public interest for the acquisition to be delayed by following the normal procedures of compulsory acquisition under this Act, the Commission may take possession of uncultivated or pasture or arable land upon the expiration of fifteen days from the date of publication of the notice of intention to acquire. On the expiration of that time NLC shall, notwithstanding that no award has been made, take possession of that land. If the documents evidencing title to the land acquired have not been previously delivered, the Commission shall, in writing, require the person having possession of the documents of title to deliver them to the Registrar, and thereupon that person shall forthwith deliver the documents to the Registrar. On receipt of the documents of title, the Registrar shall — cancel the title documents if the whole of the land comprised in the documents has been acquired; if only part of the land comprised in the documents has been acquired, the Registrar shall register the resultant parcels and cause to be issued, to the parties, title documents in respect of the resultant parcels. If the documents are not forthcoming, the Registrar will cause an entry to be made in the register recording the acquisition of the land under this Act.

**Part IX of the Land Act** provides for settlement programs. Under **Section 134 (1)**, The Commission shall, on behalf of the national and county governments, implement settlement programmes to provide access to land for shelter and livelihood.

**Subsection (2)** stipulates that settlement programmes shall, include, but not be limited to provision of access to land to squatters, persons displaced by natural causes, development projects, conservation, internal conflicts or other such causes that may lead to movement and displacement.

**2.2.8.3 Valuers’ Act, Chapter 532,**

Under The Valuers’ Act, Chapter 532, Compensation awards will be made by the National Land Commission based on land valuation determined by registered Valuers. Besides, the Valuers Act establishes the Valuers Registration Board, which regulates the activities and
practice of registered Valuers. All Valuers must be registered with the Board to practice in Kenya. The Board shall keep and maintain the names of registered Valuers which shall include the date of entry in the register, the address of the person registered the qualification of the person and any other relevant particular that the Board may find necessary.

2.3 Institutional Framework
New project developments can have major impacts on the environment including soil degradation, altering landscapes and destroying natural habitats. Other problems associated with development and human activity include land use conflicts, human and animal conflicts, water management and environmental pollution. In addition to harming the environment, these impacts can and do have significant economic costs and negatively affect human health.

In cognizance of this, the Government of Kenya has established a number of institutional and administrative entities to ensure adequate management of associated concerns and eventualities.

The following are the main institutions that perform the regulatory role and are relevant to the project.

1.1.15 2.3.1 Ministry of Water and Irrigation

The mandate is formulation, review and implementation of policy on the water sector.

The functions include:

- Water harvesting and storage infrastructure for water conservation, which will help in mitigating droughts and famine;
- Catchments area conservation;
- Water resources management policy;
- Urban and rural water development and supply;
- Waste water treatment and control;
- National water conservation and Pipeline Corporation;
- Flood preparedness and management to cope with and mitigate the impacts;
Water quality and pollution control by adopting the ‘Polluter Pays’ principles in order to ensure water user responsibility.

Relevance

Storage and utilization of water is the main driving factor in the project. Abstraction from groundwater will be guided by the ministry through WRMA. It is thus paramount that the ministry is centrally involved in the planning and operational phases of the proposed project. The following are the key institutions of relevance to this project:

(a) The Water Resource Management Authority (WRMA)

The Authority shall have the following powers and functions:

- To develop principles, guidelines and procedures for the allocation of water resources;
- To monitor, and from time to time reassess, the national water resources management strategy;
- To receive and determine applications for permits for water use;
- To monitor and enforce conditions attached to permits for water use;
- To regulate and protect water resources quality from adverse impacts;
- To manage and protect water catchments; in accordance with guidelines in the national water resources management strategy, to determine charges to be imposed for the use of water from any water resource;
- To gather and maintain information on water resources and from time to time publish forecasts, projections and information on water resources;
- To liaise with other bodies for the better regulation and management of water resources;
- To advise the Minister concerning any matter in connection with water resources.

(b) Water Service Boards (WSB)

The Boards have the following mandate:

- strengthen the institution and build its capacity;
- provide water and sanitation services in an efficient, effective, affordable and sustainable manner;
增加对水资源和卫生服务的使用和可用性；
- 增强与利益相关者的沟通；
- 在所有核心活动中的好公司治理、性别和HIV/AIDS意识活动。

1.1.16 2.3.2 **Ministry of Environment and Natural Resources**

这是负责所有涉及和受环境及其组成影响的所有问题的国家机构。

该部的核心职责包括以下内容；

- 环境和自然资源政策的制定、分析和审查；
- 可持续管理矿产资源和环境保护；
- 持续开发地理数据库，用于集成自然资源和环境管理体系；
- 实施研究和传播研究发现，用于土地资源和地质；
- 进行地质调查、矿物勘探和管理矿业和商用爆炸物的规则；
- 促进、监控和协调环境活动，并确保遵守环境法规和指南；
- 气象服务。

**Relevance**

水资源、土地、动植物和空气是自然环境的核心组成部分。拟建开发项目将利用这些资源的某一阶段或另一阶段。任何提取或贮存用途的资源都受到该部下各个项目和规定的一致协调伙伴关系，包括一致遵守相关法律规定的指导。
(a) The National Environment Management Authority

The authority is mandated to carry out, among others, the following activities in the sector;

- Promote the integration of environmental considerations into development policies, plans, programmes and projects, with a view to ensuring the proper management and rational utilization of environmental resources, on sustainable yield basis, for the improvement of the quality of human life in Kenya;
- Undertake and coordinate research, investigation and surveys, collect, collate and disseminate information on the findings of such research, investigations or surveys;
- Identify projects and programmes for which environmental audit or environmental monitoring must be conducted under this Act;
- Initiate and evolve procedures and safeguards for the prevention of accidents, which may cause environmental degradation and evolve remedial measures where accidents occur e.g. floods, landslides and oil spills;
- Undertake, in cooperation with relevant lead agencies, programmes intended to enhance environmental education and public awareness, about the need for sound environmental management, as well as for enlisting public support and encouraging the effort made by other entities in that regard;

Render advice and technical support, where possible, to entities engaged in natural resources management and environmental protection, so as to enable them to carry out their responsibilities satisfactorily.

2.4 World Bank Operational Policies

2.4.1 Operational Policy (OP) 4.01: Environmental Assessment, 2001

Environmental Assessment is used in the World Bank to identify, avoid, and mitigate the potential negative environmental associated with Bank lending operations. The purpose of Environmental Assessment is to improve decision making, to ensure that project options under consideration are sound and sustainable and that potentially affected people have been properly consulted.

<tbody>
<tr>
<td>non-governmental organizations, as early as possible, in the preparation process and ensure that their views and concerns are made known to decision makers and taken into account. Continue consultations throughout project implementation as necessary to address EA-related issues that affect them.</td>
<td>Use independent expertise in the preparation of EA where appropriate. Use independent advisory panels during preparation and implementation of projects that are highly risky or contentious or that involve serious and multi-dimensional environmental and/or social concerns.</td>
</tr>
<tr>
<td></td>
<td>Provide measures to link the environmental assessment process and findings with studies of economic, financial, institutional, social and technical analyses of a proposed project.</td>
</tr>
<tr>
<td></td>
<td>Provide for application of the principles in this Table to subprojects under investment and financial intermediary activities.</td>
</tr>
<tr>
<td></td>
<td>Disclose draft EIA in a timely manner, before appraisal formally begins, in an accessible place and in a form and language understandable to key stakeholders.</td>
</tr>
</tbody>
</table>

The World Bank has well-established environmental assessment procedures, which apply to its lending activities and to the projects undertaken by borrowing countries, in order to ensure that development projects are sustainable and environmentally sound. Although its operational policies and requirements vary in certain respects, the World Bank follows a relatively standard procedure for the preparation and approval of an environmental assessment study, which:

a) Identifies and assesses potential risks and benefits based on proposed activities, relevant site features, consideration of natural/human environment, social and trans-boundary issues;
b) Compares environmental pros and cons of feasible alternatives;
c) Recommends measures to eliminate, offset, or reduce adverse environmental impacts to acceptable levels (sitting, design, technology offsets);
d) Proposes monitoring indicators to implement mitigation measures; and
e) Describes institutional framework for environmental management and proposes relevant capacity building needs.

The environmental assessment evaluates a project’s potential environmental risks and impacts in its area of influence; examines project alternatives; identifies ways of improving project selection, siting, planning, design, and implementation by preventing, minimizing, mitigating, or compensating for adverse environmental impacts and enhancing positive impacts; and includes the process of mitigating and managing adverse environmental impacts throughout project implementation.

The World Bank considers environmental and social impact assessment (ESIA) as one among a range of instruments for environmental assessment. Other instruments used by the World Bank include regional or sectoral environmental assessment, Strategic Environmental and Social Assessment (SESA), environmental audit, hazard or risk assessment, Environmental Management Plan (EMP) and Environmental and Social Management Framework (ESMF). Environmental assessment applies one or more of these instruments, or elements of them, as appropriate.

The procedure generally follows the stages outlined below:

i. Screening at project identification stage;
ii. Scoping process during pre-feasibility and feasibility studies;
iii. Final environmental assessment; and
iv. Project completion Report;

The Bank undertakes environmental screening of each proposed project to determine the appropriate extent and type of environmental assessment. Proposed projects are classified into one of three categories, depending on the type, location, sensitivity, and scale of the project and the nature and magnitude of its potential environmental impacts:

**Category A:** the proposed project is likely to have significant adverse environmental impacts that are sensitive, diverse, or unprecedented. These impacts may affect an area broader than the sites or facilities subject to physical works. For a Category A project, the Proponent is responsible for preparing an ESIA report.
**Category B:** the proposed project has potential adverse environmental impacts on human populations or environmentally important areas such as wetlands, forests, grasslands, and other natural habitats - but these are less adverse than those of Category A projects. These impacts are site-specific; few if any of them are irreversible; and in most cases, mitigatory measures can be designed more readily than for Category A projects. Like Category A the environmental assessment examines the project's potential negative and positive environmental impacts and recommends any measures needed to prevent, minimize, mitigate, or compensate for adverse impacts and improve environmental performance. This project was assigned EA Category B.

**Category C:** the proposed project is likely to have minimal or no adverse environmental impacts. Beyond screening, no further environmental assessment action is required for a Category C project. However, an approval should be sought from NEMA on the project.

2.4.2 **OP 4.12: Involuntary Resettlement**

The World Bank policy on involuntary resettlement emphasizes that any development project should avoid or minimize involuntary resettlement and where this is not feasible, it should compensate for lost assets at full replacement cost and assist the displaced persons in improving or at least restoring their livelihoods and standards of living in real terms relative to pre-displacement levels or to levels prevailing prior to the beginning of project implementation, whichever is higher.

The World Bank OP 4.12, Annex A (Paragraphs 17-31), describes the scope (level of detail) and the elements that a resettlement plan should include.

**WB OP 4.12.(6a)** demands that the resettlement plan includes measures to ensure that displaced persons are (i) informed about their options and rights, (ii) consulted on, offered choices among others and provided with technically and economically feasible resettlement alternatives, and (iii) provided prompt and effective compensation at full replacement costs;

**WB OP 4.12 (8)** requires that particular attention should be paid to the needs of vulnerable groups among those displaced such as those below the poverty line, landless, elderly; women and children and indigenous peoples and ethnic minorities;
**WB OP4.12 (12a)** states that for households depending on land for their livelihoods preference should be given to land based solutions; however, payment of cash compensation for lost assets may be appropriate where livelihoods are land-based but the land taken for the project is a small fraction (less than 20%) of the affected asset and the residual is economically viable;

**WB OP4.12 Para (6 b & c)** state that in case of physical relocation, displaced persons should be (i) provided with assistance (such as moving allowances) during relocation; and (ii) provided with residential housing, or housing sites, or, as required, agricultural sites for which a combination of productive potential, location advantages, and other factors is at least equivalent to the advantages of the old site.

**Land acquisition in relation to the WB policy**

Land for the proposed project was acquired from Mrs Grace Njoki on a willing buyer willing seller basis and was compensated Ksh 2.4 million on replacement cost.

**2.4.3 OP 4.04: Natural Habitats**

The policy is designed to promote environmentally sustainable development by supporting the protection, conservation, maintenance and rehabilitation of natural habitats and their functions. The policy seeks to ensure that World Bank-supported infrastructure and other development projects take into account the conservation of biodiversity, as well as the numerous environmental services and products that natural habitats provide to human society. The policy strictly limits the circumstances under which any Bank-supported project can damage natural habitats (land and water area where most of the native plant and animal species are still present). This project has no significant interaction with natural habitats. This policy is, therefore, not triggered.

**2.4.4 OP 4.11: Physical Cultural Resources**

This policy is meant to assist in preserving physical cultural resources including the movable or immovable (above or below ground, or under water) objects, sites, structures, groups of structures, and natural features and landscapes that have archaeological, paleontological, historical, architectural, religious, aesthetic, or other cultural significance including sites and unique natural values. Physical cultural resources are important as sources of valuable scientific and historical information, as assets for economic and social
development, and as integral parts of a people’s cultural identity and practices. The objective of this policy is to avoid or mitigate adverse impacts on physical cultural resources from development projects. No cultural resources and sites were identified in the area and therefore this policy is not triggered.

2.4.5 **OP 4.36: Forests**

The policy on forest safeguards seeks to realize the potential of forests to reduce poverty in sustainable manner, integrate forests effectively into sustainable economic development and protect the vital local and global environmental services and values of forests. Among the principles is to screen as early as possible for potential impacts on forest health and quality and on the rights and welfare of the people who depend on them. The project area is fully habited with intensive social and economic activities. The policy is, therefore, not triggered.

2.4.6 **OP 4.10: Indigenous Peoples**

This policy contributes to the Bank’s mission of poverty and sustainable development by ensuring that the development process fully respects the dignity, human rights, economies and cultures of indigenous peoples. For all projects that are proposed for Bank financing and affect indigenous peoples, the Bank requires the borrower to engage in a process of free, prior, and informed consultation. There are no indigenous peoples identified in this project area.

2.5 **Environmental, Health and Safety Guidelines**

The IFC EHS guidelines are technical reference documents with general and industry-specific examples of Good International Industry Practice (GIIP) as defined in IFC's Performance Standard 3: Resource Efficiency and Pollution Prevention. The guidelines are inclusive of various aspects such as:

- Environment
- Occupational health and safety;
- Community health and safety; and
- Construction and decommissioning
All of these are relevant to this project. The ESMP has summarized all the anticipated impacts according to the various phases of the project. In determining these impacts, public consultations were also conducted to get the views of the various stakeholders and the key impacts that will arise with the implementation of the project.

The General EHS Guidelines contain information on cross-cutting environmental, health, and safety issues potentially applicable to all industry sectors. The relevant Industry Sector Guideline(s) is the Water and Sanitation guidelines. The EHS Guidelines for Water and Sanitation include information relevant to the operation and maintenance of (i) potable water treatment and distribution systems, and (ii) collection of sewage in centralized systems (such as piped sewer collection networks) or decentralized systems (such as septic tanks subsequently serviced by pump trucks) and treatment of collected sewage at centralized facilities.

Information on potable water treatment and distribution systems is therefore relevant to the proposed project.
Chapter Three

3. PROJECT LOCATION AND DESCRIPTION

3.1 Introduction
This chapter focuses on the project description. It discusses the project goal and location, overview of borehole and the process of borehole construction. The objective is to provide a systematic account of the activities involved in the construction of borehole.

3.2 Location of the Project
The proposed borehole site is located at Ondiri village, Kiambu County at GPS coordinates 01.24439°S, 036.65576°E. The proposed project site is rural used for subsistence cropping especially maize and other food crops with livestock keeping.

Borehole site at Ondiri area, Kiambu County.
3.3 Project Goal
The goal of the project is to improve access to portable water within Ondiri village. Increased access to water is expected to boost livestock production leading to improved livelihoods. To increase access to water, the project aims to increase the water accessibility for the community to within 30 minutes’ walk or less and raise the current accessibility.

3.4 Boreholes in the Project Area
Hand-dug wells are the most commonly used source of water in the area, constituting almost 60 per cent of the total number of water sources in the study area.

3.5 Project Implementation
The scope of the proposed project will include the following:

i. Drilling of a borehole;
ii. Installation of an electric pump;
iii. Pipework;
iv. Construction of storage tank; and
v. Construction of a pump house.

The design period will be 20 years, with the initial year (when the new system is expected to be commissioned) taken as 2015, future year 2025 and ultimate year as 2035.

The design of the water supply system was carried out on the basis of the following design Codes and Standards, among others:

- WHO Report No. 4 - Selection and Design Criteria for Community Water Supply Projects;

The above references are used in a complementary manner. Where requirements of two or more codes or standards are found to conflict, the more stringent of them was adopted for the purpose of this project.

3.5.1 Borehole Drilling
The Borehole will be drilled to a depth of 170m. Estimated borehole yield is 76.5m³/hr. The borehole diameter will be 300mm cased with 252mm diameter steel casing. During drilling a 15” temporary casing will be installed up to a depth of 10.6m due to collapsing sides.
Once the borehole has been drilled, testing is done in order to:

(i) Confirm yield, efficiency and performance
(ii) Investigate water quality
(iii) Assess whether abstraction can be sustained in terms of yield and quality
(iv) Identify potential impacts
(v) Characterize the aquifer properties such as transmissivity, hydraulic conductivity and storage

Upon completion of the drilling and installation of casing/screens, borehole cleaning will be done until the water is completely free from fine particles. This will remove the native silts, clays and drilling fluid residues deposited on the borehole wall and adjacent portions of the aquifer during the drilling process. Cleaning shall be carried out by airlift pumping, surging, backwashing or jetting.

3.5.2 Electric pump

Electricity main is necessary to install electrically driven submersible pumps. The borehole will be equipped with a grundfos submersible pump SP 46-24 to a depth of 146m and a 37kW Grundfos motor. The draw-off pipes will be 100mm diameter GI pipes with crane sockets (24No 100mm GI class “B” pipes and 1No 1m 75x100mm 3m GI reducer pipe starter pipe). An MP204 black box pump control unit will also be fitted in addition to the pump control unit. The pump is normally quite durable. In terms of maintenance the pump requires well trained personnel. The disadvantages of electricity is that it can be expensive especially during drought. There are also power outages from time to time.

3.5.3 Pipework

A total of 216m 150mm GI pipeline will be done along the existing feeder roads in the area. This will then be connected to an existing pipeline for Kikuyu Water Company all the way to the tank at Gichuhiru which is 6kms away.

3.5.4 Storage tank

An elevated pressed steel tank with a capacity of 48m3 on an 18m high tower will be installed. The tank will be located at Gichuhiro site on UTM 0236894 Easting and 9859159 Northing on approximate elevation of 2083 meters above sea level. The tank location is about 6km from the borehole site. Water will be pumped from the borehole to the tank.
Distribution to the consumers will be by gravity from this tank. The tank will provide storage required to even out fluctuations in demand and supply and to provide emergency storage when there is a breakdown in pumping equipment. It will also act as a balancing tank to reduce peak flows in the rising main and as a discharge point for the pumping system. The Practice Manual for Water Supply Services in Kenya recommends a storage size for ½ day demand. However the storage will be sized according to the borehole yield.

3.5.5 Pump house

A new pump/control house will be constructed with a metal door and a concrete roof.

3.6 Project Management

The project will be under the management of KWCL. The project will be under the management of a board of directors. Their role should be supervisory whereby the project should have a care taker who would be responsible for the day-to-day running of the scheme.

Chapter Four

4. ENVIRONMENTAL BASELINE CONDITIONS

4.1 Overview
This section presents the geographic characteristics, baseline environmental conditions including the socio-economic conditions within 2km² of the site. For convenience, the description of the larger Kiambu area is provided followed by presentation of details that are more specific to the project site. It should however be noted that the comprehensiveness of the descriptions of the general geographic and environmental characteristics of the study area is variable being governed by availability of relevant data and information.

4.2 Bio-physical environment

4.2.1 Topography and Drainage
The project site lies at about 1549 meters above sea level. Regionally, it is classified in the lower highland topographical zone. Locally, the compound lies on a flat ground.

The main drainage follows the regional slope of the volcanic rocks. The general area falls in the drainage basin of the Athi River which flows South-eastwards; in this case represented by the tributaries of river Ruaka.

Forests in the region are mainly protected catchments areas serving a conservation function. There is hardly any commercial exploitation apart from local supply of firewood. The few forest resources available in the district are not for any economic exploitation, but more for necessary environmental management. Re-afforestation and afforestation are priority activities in the area.

4.2.2 Climate
The general climate of Kiambu County exhibits bimodal rainfall pattern the short rains fall
between October and December while the long rains fall between March and May. Mean annual rainfall ranges from 1100 mm. This bimodal pattern has been disrupted by human activities resulting in delayed rainfall with cloudiest part of the year occurring just after the first rainy season.

The mean daily temperatures rise steadily to highs of about 26 degrees centigrade and to lows of about 12 degrees centigrade. Temperatures are high in the months of January to mid-March just before the long rainfalls and lowest in the month of July. In a typical day, humidity starts off with nearly saturated levels in the morning hours, and steadily decreases throughout the day.

4.2.3 Geology and Soils

The geology of the study area is described by E.P Saggerson (1991). The area is covered predominantly by Tertiary and Pleistocene volcanic rocks, mainly basalts, trachyte, tuffs, agglomerate, phonolites and their weathered products of laterites and clay. These thick volcanic rocks overlie the Precambrian basement which occurs at great depth.

The characteristic of soil found at the site are largely red – brown volcanic soils with lateritic material which support lush vegetation.

4.2.4 Hydrology

The occurrence of the ground water in the district depends mainly on the varied rock conditions, physiographic nature of the area, the permeability and porosity of the rock formation as well as the weathering extent. Aquifers in the area comprises of weathered and fractured zones as well as buried channels on old land surfaces. Transmissivity and hydraulic conductivity values have been estimated at 5 m²/d and 3.3 m/day respectively giving groundwater flux of 174 cubic meters per day.

The primary recharge source of the aquifers in the area is lateral inflow from the catchment areas located in the south of the Aberdare Ranges and the Kikuyu Escarpment. However, secondary replenishment is partly through infiltration and percolation of the annual precipitation and from streams and rivers.
The aquifers in the study area are therefore adequately replenished from the underground storage reservoir that is several orders larger than the imposed abstraction, thereby ensuring a reliable long-term water supply.

4.2.5 Water Resources

The sub-county has vast ground water potential because of high amounts of rainfall. The water table is very high in most parts. However, the resource has not been fully exploited due to financial and technical resource constraints. Water for domestic use is mainly supplied by KWCL. Except for the Kikuyu Springs, the area has no surface water resources and relies mostly on groundwater resources to meet its water demands.

Hand-dug wells are the most commonly used source of water in the area, constituting almost 60% of the total number of water sources in the study area. Boreholes are another major source of water in Ondiri area, other sources include rivers and springs.

The constituency lacks sufficient water storage facilities, wetlands have been encroached by farmers, poor distribution systems and non functional pumps in the boreholes. There is need to replace existing distribution systems with new and bigger diameter pipes, and re-test pumps to confirm their actual capacities and service them accordingly to enhance production. The current water storage tank of 50m³ is not adequate. There is a proposal to increase the storage to 150-200 m³ once the new proposal is up and running. Conservation of water catchments areas is paramount as well as building of dams and directing water into those dams.

4.2.6 Air Quality and Ambient Noise

The project site environs are predominantly agricultural and residential with some institutions including schools and churches. As such, air and noise pollution levels are low with the only major source of emissions being vehicular emissions from traffic along the busy southern by pass and other tarmac roads within the project area.
4.2.7 Flora and Fauna

The sub-county has both exotic and indigenous vegetation. Kikuyu is privileged to have relatively high forest coverage of more than 60 ha of forest (Thogoto, and Muguga forest). The Kenya Forest Service and Kenya Wildlife Service are keen on protecting and managing the forests coverage in the constituency. Some forests however have been cleared for firewood, agriculture and settlement posing a threat to water catchments in the area.

Trees are used mainly for shade, boundary demarcation, fencing, and production of fruits, timber, and fuel wood and for ornamental purposes. Common trees in the area include: *Eucalyptus* spp, *Markhamia lutea*, *Cupressus lusitanica*, *Bischovia javonica*, *Croton megalocarpus* and *Pinup* sp. Common fruit trees are *Persea americana*, *Syzygium guinii* and *Eryobotria japonica*. Shrubs include *lantana camara*, *Tethonia diversifolia* and *Solanum incanum*. Animals in the district are mainly domestic animals such as cattle, sheep, goats, pigs and poultry. There are no animals or resources of wildlife and tourism importance.

Indigenous vegetation cover of the proposed borehole site consist of grass, flowery shrubs, bushes and large indigenous and exotic trees including cypress, croton megalocarpus, silver oak, eucalyptus are found along the perimeter walls of the site. It should be noted that the vegetation within the proposed site does not merit special conservation status since it is of least cultural importance.

4.3 Socio-Economic setting

4.3.1 Target Population

Population is a major driver of environmental change in the area and as such is a determinant of other parameters such as land-use patterns, settlement and water consumption. The proposed project will serve approximately 1000 households for water supply to be used for both domestic and livestock farming.

According to 2009 national census, Kikuyu sub-county had a total population of 265,829 persons 130,370 being male and 135,459 females. The population density is 1,126 per square kilometre. It has a total of 77,045 households with an average of 3 to 4 people per household.
4.3.2 Administrative units

Kikuyu constituency comprises of five wards namely; Kikuyu, Kinoo, Sigona, Karai and Nachu. Kinoo ward is the most densely populated with a population density of 4,298.7 persons per square kilometer. Kikuyu ward followed by with a population density of 1,543.9 persons per square kilometer. Nachu ward has the lowest population density of 193.7 persons per square kilometer. Further, the table shows that Kikuyu constituency has five wards with 12 sub-locations.

4.3.3 District Development Concerns

Kikuyu is a cosmopolitan sub-county in Central Kenya. It lies within the Nairobi metropolis and Kikuyu town is approximately 25km from the city centre. There are 4 divisions, 14 locations and 30 sub locations in the newly created Kikuyu district. The divisions are; Kikuyu which has 3 locations and 6 sub locations; Kabete which has 4 locations and 8 sub locations; Karai which has 4 locations and 8 sub locations; and Kinoo which has 3 locations and 6 sub locations. It has a large network of roads with the main Nairobi-Nakuru road cutting right across the constituency. The southern by pass which is currently under construction cuts right across Kikuyu town and is foreseen to boost the trading activities once completed. The sub-county is also privileged to have a railway line (with an active station) connecting it to the city and western region. The high speed internet fibre optic cable also runs through it.

The main economic activity of Kikuyu is mainly agriculture and commerce. The constituency is a main supplier of horticultural produce like vegetables to the city of Nairobi. Besides, it is well known for poultry rearing and dairy farming. Other constituents have invested in rental houses while a lot others engage in small scale farming. It has one of the largest closed air markets (Wangige market) and several slaughter houses that supply meat to the locals and city dwellers in Nairobi and plans are underway in the economic stimulus programme to construct a fresh produce market at Kikuyu town. There are many stakeholders within the district who are working closely with the constituency office.

At the heart of development initiatives in the district is the District Development Committee (DDC) composed of all departmental heads, Member of Parliament, NGOs, District officers,
Religious leaders, Chairman of local authorities, parastatals and business community representatives.

4.3.4 Education Sector

Kikuyu constituency has 146 Early Child Development (ECD) centers which have 233 teachers with pupil enrollment of 12,550 in 2014. For primary education, there are 62 primary schools comprising of 30 public and 32 private schools. The teacher pupil ratio is 1 teacher for every 32 pupils. In comparison to 2014 the total primary enrollment rose by about 6 percent from 14,267, in 2013 to 13,373 in 2015.

Kikuyu constituency has 31 secondary schools comprising of 14 public and 17 private schools. It boasts of two of the best secondary schools in Kenya; Alliance Boys and Alliance girls High Schools. The teacher pupil ratio is 1 to 23 and the total enrollment is 16,409 comprising of 8,384 boys and 8,025 girls. For tertiary education, Kikuyu constituency has one university campus/college and one teachers training college. Additionally, the total number of people in adult education was 300 comprising of 93 males and 207 females. The transition rates for primary schools to secondary schools for 200 Mean Score (M.S.S) and above is 77.4%, 48.8% being for the public primary schools while 28.6% is for the private primary schools. The transition rates from Secondary schools to Universities for a grade of C+ and above is 39.4% while from Secondary schools to colleges and universities for a grade of D+ and above is 63.1%. Separating between private and public schools and excluding the two Alliance High Schools, the transition rate from public secondary schools to universities for a grade of C+ and above is 5.6% and for a grade of D+ and above is 24%. Transition rate from private secondary schools to universities for a grade of C+ and above is 1.7% while that for a grade of D+ and above is 5.9%.

The education sector continues to record poor performance faced by a number of challenges including very low transition rates, poor infrastructure in schools, very high levels of poverty especially in Nachu ward, poor academic performance of students, increasing levels of alcohol and substance abuse especially among the boy child, absent parenting and increased absenteeism by teachers.
4.3.5 Health

There is an established public health department in Kikuyu sub-county. It has numerous health facilities including 3 health centres (Nyathuna, Lusigetti, Wangige), 2 Dispensaries (Gichuru, Uthiru), 52 private clinics, 2 nursing homes and 2 faith based clinics. The public health department has established community units each with 5000 individuals. So far 8 units have been established and 25 units are anticipated in the future. In each of these units community health workers are assigned to train 20 households on treatment on minor ailments, homecare for patients, referral cases, use of first aid kits and jigger treatment.

On average, residents of Kikuyu constituency travel for about 5 kilometers to a health facility. However, the constituency faces a number of health challenges for example, contraceptive acceptance is very low (at 18.2%). Children vaccination coverage is relatively low at 65% with limited access to dental care. Just like nationally, the constituency loses children especially to under 5 diseases including Pneumonia, Diarrhea and Malnutrition. The most prevalent diseases in Kikuyu constituency were upper respiratory diseases (38,336), diarrhea disease (6,246), skin diseases including ulcers (12,336), pneumonia (3,052), eye infections in infants (588) and hypertension/diabetes (4,587). The lifestyle diseases also known as Non Communicable Diseases have been on the increase due to bad lifestyle like food, lack of exercise and too much alcohol intake. New antenatal care attenders and re-attenders were 2,883 and 6,136 respectively. During the year 2014, the total delivery for Kikuyu was 2,034, doctors who assisted in delivery were three and there were 30 midwife/nurses who assisted in delivery. Other challenges that face the health sector include; low awareness of preventive health care and high cost of health care services.

4.3.6 Physical Infrastructure

Lack of physical planning and housing in the sub-county has resulted to lack of supportive infrastructure such as drainage and sewerage, and irregular land grabbing of public property. It is foreseen that if planning does not take place within the next ten years it will be one huge slum. This is because there are numerous unplanned structures coming up in the constituency as many people are turning their ‘shambas’ into residential plots. Most road reserves have been encroached on by agricultural activities, human settlements, kiosks and
stalls following irregular allocation of public land to individuals. There is increased subdivision of land and an increase in the number of inhabitants despite the lack of a sewerage system.

The Kiambu County Government is at the forefront in curbing this trend by ensuring efficient and effective land use by identifying residential areas, industries, public areas, as well as commercial areas so as to ensure that land use is effective and efficient. Plans are underway for some areas such as Mwimuto which has no public utility to purchase or compulsorily acquire land to be able to offer people better lifestyles. There is need to plan for recreation facilities in each sub location so as to engage the youth and have a healthy and fit populace.

4.3.7 Roads

Kikuyu has a fair coverage of classified roads of bitumen, gravel surface and earth surface. Only about 16 Kms in Kikuyu constituency are tarmacked (excluding the highway and the bypass). These roads are frequently maintained by funds from the Constituency Development Fund, Kenya Rural Roads Authority (KeRRA) and the County Government. The main Nairobi- Nakuru highway and the Southern bypass are under the national government.

The main Nairobi- Nakuru road traverses the constituency and has five underpasses at Uthiru/ Kinoo; Regeni, Gitaru, Zambezi, Kiambaa and Chunga Mali all of which fall under the Kenya National Highway Authority (KeNHA). The maintenance of roads along the highway from Uthiru to Gitaru also falls under the KeNHA. The recently completed Southern bypass is likely to boost trading activities as it cuts right across Kikuyu town. Other supporting infrastructure is the Nairobi- Kisumu railway line which cuts across Kikuyu town.

Most of the road networks in the constituency are murram and earth roads and are not in good condition to enhance effective movement of goods and services and they worsen during the rainy season. The accessibility of markets by farmers to sell their produce and acquire inputs is hindered by the poor state of roads, especially when farmers cannot deliver their perishable produce (e.g. horticulture, milk and vegetables) to the market on time.
The road network therefore needs upgrading, regular maintenance and rehabilitation to make it passable throughout the year. Other problems in the roads sector include encroachment on the road reserves and inadequate funding.

### 4.3.8 Commerce and Trade

The people of Kikuyu are largely dependent on agriculture for income majority of who have very small pieces of land. The district has a fully fledged department of Agriculture and department of Livestock and fisheries that support the farmers especially by training farmers on crop management, soil conservation, animal husbandry and agribusiness. There is a dairy cooperative in Wangige processing milk. Fish farming will soon become a reality with the implementation of the government initiative of improving the food security by rearing fish. Farmers will be encouraged to plant strawberries, mushrooms, silkworms and jatropha so as to increase their incomes.

### 4.3.9 Agriculture

The Government of Kenya has identified flagship projects to be undertaken under the agricultural sector in Vision 2030. These include: exploiting the 9.2 million ha irrigation potential; developing water resources for livestock, domestic and irrigation use; constructing roads; managing natural resources; facilitating sustainable exploitation of renewable sources of energy to support agricultural development; exploring the possibility of providing a livestock insurance scheme for producers in arid and agricultural areas; and improving technical capacity of communities. More than 50% of agricultural land in Kikuyu constituency lies in the semi arid Nachu and Karai wards that have suffered from perennial food shortages during the dry spells.

### 4.3.10 Information Communication and Technology

Kikuyu boasts of good electricity coverage providing opportunity for investments and economic growth. It is also privileged to have the fibre optic cable running right through. This provides an opportunity to make Kikuyu an ICT hub where all institutions, schools, churches, corporate and even Small Medium Enterprises (SMEs) embrace technology. Further the constituency looks forward to having an investor put up a business park for
outsourced services for both local and international clients. The closeness to the city has enabled majority of the young generation to be computer literate. Besides the constituency have several computer training colleges.

4.3.11 Energy

As of 2013 data, the households that had electricity connection in Kikuyu constituency were 54,111. However, a large number (13,666) of the households use lantern while 7,783 of the households use tin lamp as main lighting fuel. Though residents of Kikuyu constituency have opportunities for tapping into solar energy, only 271 households used solar energy as their main source of lighting fuel. The national government through the Kenya Power and Lightening Company (KPLC) has lowered the cost of power connection by more than half to Kenya shilling 15,000 and has come up with a loan facility that allows people to repay their power connection fee monthly. Kikuyu constituents need to be made aware of this new development and should be encouraged to apply for power connection to increase rural electrification.

4.3.12 HIV/AIDS

Kikuyu area still faces the burden of HIV/AIDS whose prevalence rate for 2014 was 3.6 percent as well as tuberculosis. The transmissions are now higher among married people. There is no solid program for HIV/AIDS and there is need to set up one as well as strengthen community links.

4.3.13 Gender

In the project area, the following issues related to gender were identified;

- Imbalance accesses to and control of family resources.
- Inadequate gender sensitivity and responsiveness.
- Poor integration of gender issues in the community planning process.
Chapter Five

5. PUBLIC CONSULTATION AND PARTICIPATION

5.1 Introduction
This chapter outlines the key issues raised by the public on the proposed project. The findings indicate that all the community members support the project as long as they are involved and fully sensitized on the same.

5.2 Objectives of Public Consultation
The need for public consultations as required by EMCA (1999) was to:

✓ Disseminate and correctly inform the stakeholders about the project, its key components, location and expected impacts;
✓ Awareness creation on the need for EIA;
✓ Gather comments, concerns and suggestions of the interested and affected parties;
✓ Ensure that the concerns of the stakeholders were known to the decision-makers early enough; and
✓ Incorporate the information collected into the EIA study.

The purpose for such a process was to identify the positive and negative impacts and subsequently promote and mitigate them respectively. It also helped in identifying any other miscellaneous issues which may bring conflicts in case project implementation proceeded as planned.

5.3 Interested and affected stakeholders consulted
The stakeholders consulted in this study were: community elders, location chiefs, area leaders and community members.
5.4 Issues Raised

1.1.17 5.4.1 Water Scarcity

Community members reported that scarcity of water was a serious challenge in the area. They were optimistic that construction of borehole will complement the existing water sources and reduce traveling distances to water points.

1.1.18 5.4.2 Water Conflicts

The issue of water conflicts was discussed. Community members were asked whether water would be a source of conflict. Most of the community members were of the view that they have no water conflicts.

1.1.19 5.4.3 Beneficiaries

The community members informed the EIA team that women and children will be the greatest beneficiaries of the borehole project as they are the ones tasked with the duty of fetching water. Consequently, time wasted in search for water will be used for other constructive activities. Additionally, the danger posed to women and children during the search for water will greatly reduce.

5.5 Summary of response from the community members interviewed

6. ANALYSIS OF PROJECT ALTERNATIVES

6.1 Introduction
The consideration of alternatives is one of the more proactive sides of environmental assessment enhancing the project design through examining options instead of only focusing on the more defensive task of reducing the adverse impacts associated with a single design.

The analysis of alternatives should yield a well-informed decision on the optimal project design, based on consultations with stakeholders and experts. This calls for the comparison of feasible alternatives for the proposed project site, technology, and/or operational alternatives. Alternatives may been compared in terms of their potential environmental impacts, capital and recurrent costs, suitability under local conditions, acceptability by neighbouring land users, among other pertinent factors.

6.2 Alternative Location
Alternative location is one of the options considered for this project. In this case, the proponent will have to move the project to another site instead of implementing it on the proposed site. This is not however a feasible option considering that:

- The site has good ground water conditions and is therefore expected that the borehole will have good yield;
- The proposed site has already been acquired by the proponent;
- Finding and acquiring another land to accommodate the scale, type and size of the project and completing official transaction may take longer and delay the project and will lead to losses since another parcel has already been acquired;
✔ Even if the land was to be obtained, there is no guarantee that such land would be suitable in terms of environmental, health and safety requirements; accessibility and zoning based on land use; and

✔ Even if the land was to be obtained, the proponent will spend some more time and resources on hydro-geological investigations and other project planning activities to adjust to new site conditions, this will not be cost friendly to the proponent.

6.3 The No Project Alternative
The other best alternative to address the significant impacts is the No project alternative. This alternative will ensure that things remain unchanged. The environment therefore will not be tampered with. This option is not feasible too. This is due to:

✔ It results in losses to the project proponent and other stakeholders, society and the Government;
✔ The project would not be constructed and there would be no water supply;
✔ The land will remain idle;
✔ Lack of creation of employment, hence, effect on socio-economic empowerment of the society;
✔ Local skills would remain under-utilized; and
✔ The community will still travel long distances to access water.

6.4 Alternatives water sources
The community should consider roof catchments of rainwater to augment water supply from the borehole. Harvesting of rainwater will reduce pressure on the grounds and will provide plenty of water for use particularly for the community.

6.5 Alternative design and technology
The proposed borehole will use a submersible water pump powered by electricity. Other alternative sources is solar and diesel pumps. The diesel powered pumps will not be sustainable due to its prohibitive cost for fuel and operations & maintenance. The solar powered pump is a better alternative because of its low operation cost however the cost for installation is prohibitive and this was therefore not considered.
6.6 Input Alternatives
The choice of materials and inputs selected for the project was based on the stipulated laws, standards and specifications as commonly applied in a project of such nature. The selection of materials takes into account design specifications and end user consideration.
Chapter

Seven

7. ANTICIPATED POTENTIAL ENVIRONMENTAL IMPACTS

7.1 Introduction
This Chapter identifies and discusses both positive and negative impacts associated with the proposed borehole water project. Impacts to the environment could be positive or negative, direct or indirect, reversible or irreversible. The extent of environmental impact is determined by its significance, adversity, temporary or permanent, long-term or short-term, localized or widespread. Some impact mitigation has already been proactively addressed in the design while others would be undertaken through considered incorporation in the implementation of the project and guided by the Environmental and Social Management Plan (ESMP) presented in this report.

The anticipated impacts are discussed in three phases namely: construction, operational and decommissioning phases.

7.2 Construction Phase

7.2.1 Positive Impacts

7.2.1.1 Temporary Employment Opportunities

One of the main positive impacts during the construction phase will be the availability of employment opportunities especially to casual workers and several other specialized workers. Employment opportunities have both economic and social benefit.
7.2.2 Negative Impacts

7.2.2.1 Loss of Vegetation Cover and Biodiversity
Before the drilling and installation of the boreholes, pipeline works and construction of elevated steel tank, clearing of part of the existing vegetation cover will be done. Direct impact from such disturbance may cause changes in the natural community ecosystem or lead to invasion by non-native plant species. Loss of plant communities may also result in soil erosion and/or compaction. The loose soil material may also be washed down into the lower areas (streams and valleys).

Mitigation

- Ensure proper demarcation and delineation of the project area to be affected by construction works;
- It is recommended that indigenous trees or other fast growing trees be planted in strategic locations where the vegetation cover will be cleared as part of landscaping initiatives;
- Project implementation plans will be developed such that section excavated are worked on and completed before moving to other areas;
- Re-vegetation of exposed areas around the site will be carried out rapidly in order to mitigate against erosion of soil through surface water runoff and wind erosion; and
- Identify and restrict movement of vehicles to areas of disturbance

7.2.2.2 Alteration or Destruction of Wildlife Habitat
Drilling of borehole, laying of water pipeline and construction of water tank may have immediate impact on wildlife habitat. Alteration, fragmentation, or destruction of wildlife habitat can result in the direct loss or displacement of species and the ability of the ecosystem to support other biological resources such as the plant communities upon which the wildlife rely on for survival. The level of habitat destruction in this project is minimal as the core impact areas are quite small. There were also no observed counts of endangered animal species in the proposed construction sites.

Mitigation

- Clearance of vegetation should be done in necessary areas only; and
• Notify Kenya Wildlife Service (KWS) in case animals are encountered during construction activities.

7.2.2.3 Solid and Liquid Waste Generation
The construction works involves activities which may lead to generation of both solid and liquid wastes. These will include rejected casing materials, excavated materials and cleared vegetation among others. There will also be some solid containers such as cement bags, bentonite residuals and cement bags and other packets with materials and equipment to be used during implementation of the project. The workers at the site will also generate faecal wastes during their day to day operations. The generated waste needs proper handling to prevent diseases, such as cholera, typhoid and diarrhoea outbreak on the site. Unless this is addressed, it can prove to be an environmental/health hazard.

**Mitigation**

• Use an integrated solid and liquid waste management system which includes reduction at source, recycling, re-use, incineration, and sanitary land fills;
• Any remaining waste (paper or polythene containers, cement bags, bentonite, construction debris, etc. shall be safely burned and/or disposed in designated waste disposal areas before the project is commissioned;
• Some of the drilled materials will be used in the borehole construction by back filling the annular space. All excavated material from the draining channel will be used to refill it;
• Construction crew to be encouraged to dump their personal wastes in designated covered dustbins;
• Where no toilets exist, portable toilets and necessary sanitary arrangements will be availed; and
• Keep the site clean and orderly at all times.

7.2.3.4 Noise Pollution
The construction works will most likely be a noisy operation due to moving parts of machines (*drilling rig, pipeline excavation works and communicating workers*) and trucks that carry the equipment to the site. To some degree site workers and community members are likely to be affected since noise beyond some level is itself a nuisance and thus should
be controlled within acceptable limits. Noise levels in construction works are usually below the threshold limit (90dBA) that workers can be exposed in an 8 hours working day and is consequently not of any major concern. However, this project is generally a low noise activity where noise is confined with the excavation equipment and support vehicular traffic. The noise emitted from these equipment, however, will be minimum and within the ambient noise levels. The works will be undertaken during the day time and hence effects to night time noise will not be associated with the construction equipment.

**Mitigation**

- Adhere to the Kenya Noise Prevention and Control rule passed in 1996 under legal notice No. 296 as a subsidiary legislation to the Occupational Health and Safety Act (OSHA) of 2007 which requires putting in place measures that will mitigate noise pollution. Consider especially the rule, which states that, “No worker shall be exposed to noise level in excess of the continuous equivalent of 90 dBA for more than 8 hours within any 24 hours duration”;
- The drill rig must be fitted with appropriate noise suppression equipment such as mufflers;
- Proper maintenance of the construction equipment;
- The workers will be supplied with on ear mask where applicable to control excessive noise;
- Place noisy equipment in sound proof rooms or in enclosures to minimize ambient noise levels;
- No works during the night to prevent disruption of the neighbouring community; and
- Sensitize vehicle drivers and machine operators to switch off engines of vehicles or generators when not in use and to avoid hooting.

**7.2.2.5 Dust Emissions**

Particulate matter pollution is likely to occur during site clearance, excavation works and drilling operations. There is possibility that generated dust may affect the workers and the surrounding community members’ heath. The law requires that best management practices are adopted during drilling activities. Ideally, no visible dust should be created nor should
exhaust from any equipment be visible for more than 10 seconds. However, the potential impact on air quality will be minimal.

**Mitigation**
- Ensure that the workers have proper PPEs like dust masks;
- Ensure strict enforcement of on-site speed limits; and
- The equipment used to drill water must be fitted with dust suppressors equipment (e.g. water sprays), and pre-start inspection of dust control equipment will be undertaken.

### 7.2.2.6 Risk of Accidents and Health and Safety Concerns

During construction activities, it is expected that the construction workers may encounter occupational health hazards as a result of coming into contact and handling hazardous waste e.g. engine oil and grease. Because of clearing of access roads and water pipelines, setting up and operating the drilling machines, workers will be exposed to risk of accidents and injuries. Such injuries can result from loading and unloading truck mounted drill rig, transportation of the drill rig, hand tools and cuts from sharp objects, slips and fall hazards among others. We recommend that necessary safety precautions like defensive driving and putting up signages be taken by the truck drivers and workers to minimise accidents. The public are also potential exposed to risks of safety from the excavated trenches waiting pipe laying, access to the work areas by unauthorized members of public and potential road safety risks from trucks and vehicles accessing the site.

**Mitigation**
- Ensure compliance with occupational health and safety act, 2007;
- Ensure workers are provided with personal protective equipment and first aid kit;
- Ensure all equipment are inspected before use for appropriate safeguards and that the machine operators are trained on machine safety;
- Ensure the working hours are controlled and that employees are not allowed to extend the working hours beyond an acceptable limit for purposes of gaining extra pay;
- Ensure appropriate road safety signage are strategically placed and drivers adhere to the requirements of such signage;
• Provide adequate manual labor to meet the requirements of the tasks,
• Provide appropriate barriers along the excavated trenches. All construction sites shall be isolated from the public and their livestock. This will be done through temporary fencing and fixing appropriate safety signage and information;
• Involve the local people for enhanced ownership and management; and
• Upon completion and commissioning of the works, public safety in regard to water quality will be important. Security to be ensured for the borehole and storage tanks. Involvement of the local community will be inevitable in this regard.

7.2.2.3 Risk of Oil Spillage

The drilling machine contains movable parts which will require oiling and greasing to minimize wear and tear. Likewise the truck for carrying the drilling rig, pipes and other construction materials to site may require oil and other lubricants change. Possibilities of oil spillage contaminating the soil and water within the project areas are real.

Mitigation

• Safety procedures will be enforced to minimise cases of oil spillage. Such procedures may include maintaining the machinery in specific designated areas designed for such purposes;
• Ensure that oil/grease spills and other oils and associated materials (filters, rags and cans) are immediately removed along with all contaminated material and disposed of at an waste disposal site; and
• Ensure that contaminated materials including used/spilled oils/grease as well as other contaminated materials are stored in a banded area before being disposed off.

7.2.2.8 Groundwater Pollution

Borehole construction activities have the potential to introduce contaminants into groundwater reservoirs creating a great concern to human and animal health. Pollution of groundwater quality during the drilling may occur following one or more of the following deficiencies:

i. Insufficient or substandard well casing hence drawing contamination from the subsurface or perched water,

ii. Inadequate seal between the well casing and the borehole
iii. Poor welding of casing joints  
iv. Lack of sanitary protection at the wellhead  

The effects of the drilling process are covered in this ESIA. However, there are potential linkages of the borehole water quality during the water abstraction and distribution activities that include among others;  

i. Installation of the pumping facilities,  
ii. Car washing and services within vicinity of the wellhead,  
iii. Proximity of deep pit latrines to the wellhead,  
iv. Land use practices within the borehole area including excessive application of agrochemicals.  

Mitigation  

- Ensure that all potential sources of pollution are eliminated;  
- The proponent will adhere to the regulations set by WRMA on the amounts to be extracted from a borehole and the number of pumping hours. This helps to reduce wastage and misuse of this resource as well as ensuring equity in ground water abstractions;  
- Avoid improper land use activities within the proximity of the borehole wellhead; and  
- Undertake an audit on the integrity of the borehole abstraction piping and associated casings.  

7.2.2.9 HIV/AIDS  

The project will attract new people to the project area and this can lead to several repercussions leading to the spread of the virus. Influx of new people to the project area especially construction workers can affect the number of new cases of HIV, because they often interfere with an otherwise stable situation but the contrary can also happen where the newcomers find themselves at higher risk.  

Mitigation  

- Programs will be developed and integrated into the project implementation for sensitizing the local community and project workers on HIV/AIDS and/or other sexually transmitted diseases (STDs);  
- Review the construction activities to integrate with the HIV/AIDS campaigns;
• Develop appropriate training and awareness materials for Information, Education and Communication (IEC) on HIV/AIDS; and
• Identify other players (local CBOs, NGOs, and government organizations) on HIV/AIDS for enhanced collaboration.

7.3 Operation Phase

7.3.1 Positive Impacts

7.3.1.1 Increased Access to Water
The current water sources rapidly deplete during the dry season. Consequently, the community members have to travel increasingly far distances in search for water. During such journeys, community members have either lost lives or livestock. It is expected that the construction of boreholes will greatly improve access to water in the area. This increased access also means that there will be increased revenue for KWCL.

7.3.1.2 Permanent Employment Opportunities
Permanent employment opportunities are one of the long-term major impacts of the project that will be realized during the operation and maintenance of the borehole. It is expected that some community members will be permanently employed as borehole attendants.

7.3.1.3 Improved Health and Sanitation
The proportion of the population currently relying on water from unprotected water sources such as rivers and shallow wells will reduce significantly. These will have a direct impact on health and sanitation especially in relation to waterborne diseases such as diarrhea and helminthic infections. Families that are unable to wash clothes or bathe will be able to do so due to close proximity to water sources.

7.3.1.4 Reduced Travel Times to Water Points
From our discussions with community members, most families spend almost 30 min-1 hour in search for water. It is expected that the construction of the borehole will lead to significant time savings due to reduced distances to water points. It is expected that same will improve the economic and social status of women and children since there will be more time for other activities for example for farming.
7.3.1.5 Increased Participation of Women in Socio-economic Development

The prevailing socio-cultural norms influencing household division of labour determine that looking after children, preparation of food and collecting water and firewood are tasks for the women. By constructing borehole closer to the communities, the women will be able to spend their time in other productive activities thereby increasing their participation in socio-economic development.

7.3.2 Negative Impacts

7.3.2.1 Change in Settlement Patterns

The construction of borehole is likely to encourage permanent settlements leading to livestock and human concentration near the water points. Large concentration of domestic animals may result in heavy grazing and accompanying vegetation changes in the vicinity of the boreholes.

Mitigation

- Liaise with Kiambu county government to control developments in the area and ensure provision of adequate services.

7.3.2.2 Risk of Water Vectors

Water spillage around the taps during operation may provide breeding ground for vectors of waterborne diseases such as worms, mosquitos and schistosomiasis. With increasing population and demand of water resources, more energy may be directed into enhancing water flow but forgetting the management of sanitation and wastewater. This scenario also leads to low attention to water quality and concentrating into increasing the volume.

Mitigation

- The waste water drainage channel be constructed to lead water away from the pump pad;
- The waste water may be used for small gardening initiatives by the communities or directed to soak pits;
- Observe the Water Act 2002 and associated Water Rules;
- Conduct continuous maintenance of the borehole, pipework, tank; and
- Conduct water sampling at least every 3 months for water monitoring record base on this facility

**7.3.2.3 Lowering of Water Table**

It is expected that the water from the borehole will be used for both human and animal consumption. Consequently, the risk of over abstraction is real. This may cause lowering of ground water table which may interfere with other existing boreholes.

**Mitigation**

- The borehole will be installed with a master meter and an Airline/Piezometer to monitor ground water abstractions and to facilitate regular measurements of the static water level in the borehole, respectively;
- The maximum ground water abstraction permitted from the borehole is limited to the authorized volume per day for the domestic/industrial use only subject to availability from 60% of the tested yield for a maximum abstraction period not exceeding ten (10) hours per day;
- The water company shall ensure that there is no over pumping and also they will stick to the permit class issued by WRMA;
- Install auto-shut water taps to reduce water wastage;
- Educate and create awareness to the Community on the value of water and water resources for enhanced conservation; and
- Ensure optimum maintenance of the water supply system components including pipelines, valves and consumer taps.

**7.3.2.4 Risk of Soil Erosion**

There are possibilities of soil erosion occurring during the operation of the boreholes which may become serious when the topsoil is left bare and agents of erosion become active. Soil erosion is a serious environmental problem which should be controlled. Lost soil due to erosion is normally deposited elsewhere, and the location of the deposition could alter downstream hydrology and increase flooding. It may also interfere with water quality directly through increasing turbidity levels, siltation and indirectly from contaminants carried with or attached to eroded soil particles. The proposed project is expected to have minimal risk of erosion as the area to be disturbed is quite small.
Mitigation

- Regularly check and maintain pipes to avoid burst pipes and leakages which can lead to massive water losses (and so revenue) as well as soil loss;
- Apply soil erosion control measures such as levelling the project site to reduce run-off; and
- Ensure compacted areas are ripped off to reduce run-off.

7.4 Decommissioning Phase

Decommissioning refers to the final disposal of the project and associated materials at the expiry of the project life span or when the borehole dry up or when the community gets another water source better than the proposed borehole. During this project, the proponent will be expected to demolish the pump house, remove the casings, pump, water pipeline, elevated water tank and remediate the site.

7.4.1 Positive Impacts

7.4.1.1 Rehabilitation

Upon decommissioning of the proposed project, rehabilitation of the project site will be carried out to restore the site to its original status or to a better state than it was originally. This will include replacement of topsoil and re-vegetation which will lead to improved visual quality of the area. This will also mean that alternative options can be utilized within the project site.

7.4.1.2 Employment Opportunity

For decommissioning to take place properly and in good time, several people will be involved. As a result several employment opportunities will be created for the demolition staff during the demolition phase of the proposed project.

7.4.2 Negative Impacts

7.4.1.1 Solid Waste Generation

Demolition of project related infrastructure will result in large quantities of solid waste. The waste will include materials such as concrete, metal, wood, adhesives, sealants and
fasteners. Although demolition waste is generally considered as less harmful to the environment since they are composed of inert materials, there is growing evidence that large quantities of such waste may lead to release of certain hazardous chemicals into the environment. We recommend that proper waste disposal mechanisms be observed.

### 7.4.2.2 Noise Pollution

The decommissioning related activities such as demolition works will lead to significant deterioration of the acoustic environment within the project site and the surrounding areas. This will be as a result of the noise and vibration that will be experienced as a result of demolishing the proposed project structures.

### 7.4.2.3 Occupational Health Hazards

Demolition works will inevitably expose workers and the public to occupational health and public safety risks: in particular, working with heavy equipment, handling and use of tools engender certain risks. The construction workers are also likely to be exposed to risk of accidents and injuries resulting from accidental falls, falling objects, injuries from hand tools and other equipment.
Chapter

Eight

8. ENVIRONMENTAL AND SOCIAL MANAGEMENT PLAN (ESMP)

8.1 Introduction
This chapter presents the Environmental and Social Management Plan (ESMP) that will be implemented by the proponent to prevent, or reduce significant negative impacts to acceptable levels. This plan is not static but will be updated throughout the project life cycle.

The purpose of the Environmental and Social Management Plan (ESMP) for the proposed water Project is to provide mitigation measures for the significant negative environmental impacts. The objectives of the ESMP are:

- To clearly show how the project will manage the negative impacts while enhancing the positive ones to ensure a project that is economically, socially and environmentally sustainable;
- To provide evidence of practical and achievable plans for the management of the proposed project;
- To provide the Proponent and the relevant Lead Agencies with a framework to confirm compliance with relevant laws and regulations; and
- To provide community with evidence of the management of the project in an environmentally and socially acceptable manner.

Environmental monitoring is an applied research and analysis activity to support cost-effective and timely assessment of the status and trends in environmental and social conditions in response to different project activities. Also, it is necessary to assess the project performance against the desired mitigation measures, and compliance with the regulations and standards in order to protect people's health and safety, and the environment health and performance. Monitoring activities will be applied to direct monitoring indicators whenever applicable.
Indirect indicators can be monitored instead of direct ones whenever it would provide acceptable indication of the occurrence of specific impacts and/or compliance with provisions of the ESMP.

8.2 Implementation and operation of the ESMP
Effective implementation and operation of the ESMP require clear-cut identification of responsibilities that will guide assigning tasks. The parties responsible for implementation of the ESMP include:

i. AWSB will be responsible for coordination of all the activities and liaisons, particularly concerning the quality control of the works and social issues.

ii. KWCL will have the responsibility to enforce water quality monitoring and efficient maintenance systems, procedures to minimize interruptions to water supply and ensure accessibility by all consumers. In this regard appropriate capacity building and skills will be necessary,

iii. National Environmental Management authority (NEMA) and the Water Resources Management Authority (WRMA) through the County Directors offices shall be responsible of surveillance of environmental and social aspects of the project implementation,

iv. The County Government of Kiambu;

v. The Contractor;

vi. The Supervision Consultant; and

vii. The local administration,

Other implementation related components include:

1. Training and awareness creation;
2. Communication;
3. Emergency preparedness and response;
4. Checking and corrective action; and
5. Review of the ESMP.

8.2.1 Training and awareness creation
Efficient implementation and operation of the ESMP require competent capacities, wise management, environmentally and socially sound employees. KWCL shall be aware of the
project nature and impacts, so that they can develop their appreciation and thorough commitment to the ESMP requirements, complexity and integrity.

Each responsible person will be trained and motivated to appreciate the need for the ESMP and how to implement the mitigation measures. Training and awareness will be done in the pre-construction phase in order to have the employees acting as per the stated course of procedures and actions. Adequate training of personnel is also considered as a cost effective means to reduce impacts.

The proponent ought to ensure the following in order to fulfill the awareness and training requirements:

1) Training needs are identified;
2) Training requirements for each operational unit within the project are established;
3) Personnel are trained in their specific environmental responsibilities that are directly related to significant aspects, targets, and objectives of the ESMP;
4) Personnel that do not have a significant role, receive awareness training;
5) New-hires and re-assigned personnel are given appropriate training on the specific aspects of their new positions;
6) Personnel are kept abreast of regulatory changes that impact their job performance.
7) Training includes communication of the following:
   a) Requirements of the ESMP and the importance of regulatory compliance with policy;
   b) Potential effects of the employee's work, both negative and positive; and
   c) Responsibility in achieving compliance with policies, regulations and ESMP requirements.

8.2.2 Communication

Efficient communication should be maintained at both external and internal levels. The overall advantage of this communication program is to ensure that the anticipated adverse impacts and risks can be effectively mitigated.

The proponent will effectively communicate and cooperate on continuous basis with the related authorities in order to avoid or minimize to the extent possible disruptions.

Communicating internally and externally- if effective- will ensure:
Better understanding and appreciation of target groups to the proposed project conditions and benefits;
No or minimum disruption by the project to other developed/under-development projects and vice versa;
Minimum impacts and risks; and
Community participation in helping and making choices to develop suitable and acceptable avoidance/mitigation scenarios.

8.2.3 Emergency preparedness and response
Emergency preparedness must be given priority during the ESMP implementation and operation and all key procedures reviewed for emergency preparation, including the occupational health and safety programs for the farmers and the workers.

During the pre-construction phase, the Contractor will be required to document procedures for managing these potentialities and to train key personnel on these procedures. Also he will ensure that adequate and correct emergency equipment are available where they should be. The prepared plan documents will clearly identify implementation responsibilities.

The Emergency Management Plan will be reviewed and verified by the proponent. Also, the implementation of this plan will be monitored and evaluated. Whenever environmental and/or social emergency situation is triggered during the construction phase, the proponent shall directly inform the Contractor requesting him to respond according to the stated plan. After a drill or incidents occurrence, these processes will be reported on, reviewed and modified by the environment officer. In this regard, the environment officer will hold the responsibility of reviewing and verifying the Contractor reports and plan adaptations.

8.2.4 Checking and corrective action
The ESMP implementation and performance shall be monitored continually; performance, conformance and non-conformance audit will be applied on in order to adapt the plan by adopting effective corrections whenever needed. Environmental audit will be conducted on annual basis as required by NEMA. All records will be stored in a well-ordered and easily accessible manner, enabling individual items to be located easily and ensuring that the records are protected. The audit reports will be reported in accordance to the stated reporting structure.
The selected environmental expert will be required to possess relevant experience and capable of undertaking such responsibilities.

For the purpose of the community water supply project, the audit would cover but not limited to the following changes triggered by the community water project:

a) Technological issues related to the community water supply;

b) Socio-economic issues; and

c) Gender and socio-cultural aspects.

The corrective and preventive actions based on audit findings and their consequences will be monitored. The periodic audit findings will be summarized into an audit report and reviewed during the project review meeting by the proponent.

8.2.5 Review of the ESMP

The Environment Officer will review the ESMP on a periodic basis as per a documented procedure to ensure its continued suitability and effectiveness. During the review, the staff will effectively utilize all available information, including internal and external audit findings, environmental concerns, objectives, targets, non-conformance, and corrective and preventive actions in order to improve the ESMP implementation. The review results will be recorded and maintained and the resultant decisions and actions taken will be implemented by the concerned personnel. ESMP has been designed to ensure maximum environmental and social protection, better coordination and cooperation between the project stakeholders and minimum cost implications.

8.2.6 ESMP reporting structure

The ESMP reporting structure is as shown in table 8.2 as follows:

<table>
<thead>
<tr>
<th>Report</th>
<th>Report Type</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>Progress Report</td>
<td>Document to the ESMP implementation progress, limitations &amp; difficulties based on regular monitoring. This includes checking &amp; corrective actions. Also the progress report will address the conducted public consultation sessions.</td>
<td>Monthly, Quarterly (every three months) &amp; Annually.</td>
</tr>

<td>Evaluation Report of the Project Environmental &amp; Social Impacts. The evaluation will also document all conducted management practices &amp; evaluate the effect of these practices</td>
<td>Once upon construction completion</td>
</tr>
</tbody>
</table>

8.2.7 Environment Monitoring Plan

The Environmental Monitoring Plan is established to mitigate the identified negative impacts in the ESIA that are significantly adverse and/or the probability of the predicted impact is uncertain due to technical limitations. For this project, focus is on the key adverse impact items alongside the implementation budget listed in the table below;

Table 8.3: Environment Monitoring Plan

9. CONCLUSION AND RECOMMENDATION

9.1 Conclusion
An Environmental and Social Management Plan provided in chapter eight charts the path for sustainable project implementation. The plan provides strategies and activities that need to be implemented so as to mitigate the negative impacts. Implementation timelines, responsibilities and cost estimates are also provided where applicable.

9.2 Recommendation
It is recommended that the proponent, contractor and all the stakeholders mentioned in the ESMP implement the recommendations in the environmental and social management plan. This is to ensure that the potentially affected environment is well managed and that accidents are prevented in the course of project implementation. The Proponent is expected to comply with the relevant legal and policy requirements with regard to project implementation.

During the operation of the borehole, it is necessary that environmental regulations be strictly adhered to. The performance of the borehole will also be monitored against the recommended mitigation measures to ensure sustainability.

9.3 Overall Opinion
The construction of the borehole will have far reaching impact on the community in terms of accessibility to quality water. The project area has water challenges which continue to stifle socio-economic development and threaten livelihoods. It is for this reason that the community members are very supportive of the project. It was also established that all the identified negative impacts will be effectively mitigated through full implementation of the ESMP.

Annex 1. Chance find procedure

Any archaeological or heritage site discoveries during drilling works must be reported to AWSB and treated as an incident. Work at the area must cease immediately, the area demarcated, AWSB will investigate and, where appropriate, carry out salvage operations.

The Contractor or other person discovering a potentially significant site or artefact will initiate the following actions:

- Stop work in the immediate area and take digital photographs to record the find;
- Install temporary site protection measures (e.g. delineate a ‘no-go’ area using warning tape, stakes and signage / deploy worker and give instructions to prevent access or further disturbance) and take all reasonable steps to avoid any further disturbance or damage from drilling, excavation, machinery;
- Inform site supervisor/foreman;
- Inform all relevant staff /Contractor personnel of the chance find and whether access to work area is being restricted;
- Strictly enforce any no-go area needed to protect the site;
- Notify AWSB, who will advise on any additional measures such as deployment of security guard and consultation or a visit from archaeologist / other heritage specialist. In the event of the latter, the specialist/archaeologist will be responsible for evaluating whether the chance find needs to be classified as cultural heritage and if so, whether it is isolated or part of a larger site or feature. AWSB will also notify the National Museums of Kenya;
- Artefacts are to be left in place for recording by the specialist/archaeologist. It is important they are not disturbed or moved as there setting is as important as the artefact/fossil; if materials are to be collected they will be placed in bags and labelled by the specialist /archaeologist and forwarded to the authorities in a manner that ensures the integrity of the ‘chain of custody’. Project personnel are not permitted to take or keep artefacts as personal possessions as that is a crime;
- Any damage, accidental or otherwise, should be investigated by the site foreman.
and AWSB. The details are then recorded in an Incident Report and, if necessary an Incident (Chance Find) Investigation Report;

- Appropriate mitigation / treatment strategies will be developed according to the specific circumstances of each find and, as appropriate, take account of the degree of cultural importance of the find. Stakeholder engagement may be needed with affected communities to determine the correct mitigation actions or, if applicable, suitable compensation (e.g. reburial costs). Site treatment scenarios may include:
  - Preservation in place through avoidance or specialized drilling techniques, and/or
  - Rescue excavations to remove, record and relocate in advance of further construction work if avoidance is not possible.

- If the Chance Find is an isolated artefact/site or is not classed as cultural heritage, AWSB must approve the removal of site protection measures and activity can resume only with consultation and approval of the local authorities;

- If the heritage specialist and/or archaeologist confirms the chance find to be cultural heritage, he/she will inform AWSB and initiate discussions about the handling process;

- If a chance find is a verified cultural heritage site, prepare a final Chance Finds report once required treatment has been completed;

- While required treatment is ongoing, AWSB will coordinate with the relevant staff / contractor, keeping them informed as to status and schedule of investigations / actions, and informing them when activities may resume;

- Chance find recording shall include the following:
  - Incident Notification;
  - Incident Report;
  - Incident (Chance Find) Investigation Report – e.g. detailing corrective actions, with digital images, maps and plans showing any locations that are no-go, limited access or present risks of further chance finds;

- AWSB shall collate data and report Chance Finds and related activities on a regular basis during construction phase in accordance with the Project’s monitoring and reporting programme;

- The action taken and outcome will be recorded in the environmental issues register.
Annex 2: Map of proposed location

The tank will be located at Gichuhiro 6km from the tank. A major section of the pipeline is existing. Only a total of 216m 150mm GI pipeline will be done along the existing feeder roads in the area. The existing line at Gichuhiro belong to Kikuyu Water Company who are the beneficially of the project.

Annex 4: Sample Questionnaires
Athi Water Services Board has contracted **Kenface Enconsults (Africa) Ltd** to conduct reviews of ESIA and RAP studies that were done for boreholes and water supply systems located in regions covered by **Athi Water Service Board**. The National Environment Management Authority (NEMA) requires that consultation and public participation be done during Environmental Impact Assessments and Audits as stipulated in part IV of the EIA/EA regulations 2003. The projects are likely to impact on the environment and hence the ESIA and RAPs were conducted in counties spread out within the operation areas of Athi Water Services Board.

**Project Name:** Ondiri borehole

---

Your response is confidential and will be treated as such.

1. Has there been water shortage in this locality? 
   - Yes. If so, explain

2. How is the project under implementation going to alleviate the problem?
   - There will be no more water scarcity

3. What positive and negative impacts in your opinion will arise from implementation of this project?
   - Positive: Employment, Water availability

4. Was the local community consulted at the design stage of the project?
   - Yes

5. What operation and maintenance arrangements for the project have been made by the community?
   - Owning the land

6. Do you have a water users association and by-laws for the project? 
   - Yes. If so, for how long has it been in existence? 
     - Yes. How is the security of tenure guaranteed for the officials?

7. In your opinion, what organizational arrangements are required to sustainably manage the water supplied by the project?
   - Lay water collectors and have a queue

8. How do you intend to regulate and use the water from this project? What are the priority water uses in the locality?
   - Domestic use

Your response is confidential and will be treated as such.-

1. Has there been water shortage in this locality? ...yes... If so, explain
2. How is the project under implementation going to alleviate the problem?

   Water shortage will be the end of Ondiri locality

3. What positive and negative impacts in your opinion will arise from implementation of this project?

   positive - Water availability
   employment
   negative - Noise & Dust

4. Was the local community consulted at the design stage of the project?

   yes

5. What operation and maintenance arrangements for the project have been made by the community?

   Each member should pay water bill at the end of the month.

6. Do you have a water users association and by-laws for the project? ...yes...if so/ for how long has it been in existence? Jyks... How is the security of tenure guaranteed for the officials?

7. In your opinion, what organizational arrangements are required to sustainably manage the water supplied by the project?

   Secure the site and a guard should be employed

8. How do you intend to regulate and use the water from this project? What are the priority water uses in the locality?

   farming & domestic use

District/Location ........................................... Date and Stamp ................................
Athi Water Services Board has contracted Kenface Enconsults (Africa) Ltd to conduct reviews of ESIA and RAP studies that were done for boreholes and water supply systems located in regions covered by Athi Water Service Board. The National Environment Management Authority (NEAMA) requires that consultation and public participation be done during Environmental Impact Assessments and Audits as stipulated in part IV of the EIA/EA regulations 2003. The projects are likely to impact on the environment and hence the ESIAAs and RAPs were conducted in counties spread out within the operation areas of Athi Water Services Board.

Project Name
